

Summary

CSLB Behring (CSLB) is requesting approval to manufacture lyophilized Factor XIII Concentrate (Human) for prophylactic treatment of congenital Factor XIII deficiency. On January 16, 1985, FDA granted orphan designation to FXIII Concentrate (Human) for the treatment of FXIII deficiency under application No. 84-0044. This FXIII Concentrate (Human) BLA was submitted as an electronic document under the accelerated approval program and was granted priority review. CSLB plans to market this product which is a longer acting version than currently marketed FXIII products, using the trade name of “Corifact™.” CSLB has been approved by the EU for more than 12 years to market this product in Europe and other regions of the world outside of the United States as Fibrogammin P®. The primary difference between the manufacture of Fibrogammin P® for the EU and “Corifact™” is that “Corifact™” will be only be sourced from US licensed plasma centers.

There were two DMPQ review issues for this submission. The first issue was that the sensitivity of CSLB's -----(b)(4)-----
-----CSLB was contacted during
this review and provided -----

------(b)(4)------
-----.
-----The second issue for this review was
that the -----(b)(4)-----
did not reflect CSLB's in process capabilities which documented results of ---(b)(4)-----. After
discussion with FDA, CSLB provided in Amendment #8 a revision of their protocol in the
submission which states that they have now revised their in process parameters for this -----
------(b)(4)----- is exceeded, CSLB
will investigate the lots.)

The CSLB facility has been inspected several times in the last two years with a routine GMP inspection completed in April 2010, a routine biennial GMP inspection in 2008, and a May/June 2008 (PAI for C1 Esterase Inhibitor). These biennial and PAI inspections were classified as VAI. With this inspection history, an inspection waiver was requested and the approved memorandum has been placed in the EDR.

Items Reviewed

- BLA 125385/0; an ectd submission dated August 18, 2010,
- BLA Amendments #1, #4, #8, and #9;
- Teleconference memorandums dated August 20, 2010 and January 18, 2011
- Vial stopper information in -----(b)(4)-----.

The final review of the product and stability data has been deferred to the product office.

Summary Conclusion: CSLB will need to provide the data that they have agreed upon -----
----- (b)(4) ----- . CSLB has amended their
requirements for their ----- (b)(4) -----

----- There are no other issues identified during this review that would prevent approval.

Review Narrative

Description of Product

Factor XIII Concentrate (Human) or “Corifact™” is a sterile, preservative free, heat-treated, lyophilized FXIII (coagulation factor XIII) concentrate. It is derived from human plasma that is sourced from U.S. licensed centers as per 21§CFR 640.60. Each vial contains 1000-1600 IU Factor XIII, 120 to 200 mg human albumin, 120 to 320 mg total protein, 80 to 120 mg glucose and 140 to 220 mg sodium chloride. The final packaging of this product is a kit containing one single-use 30 mL vial of the lyophilized Factor XIII Concentrate (Human), a 20 mL vial of Sterile Water for Injection (USP) to be used for reconstitution, a Mix2Vial filter transfer set, and one alcohol swab. The final FXIII Concentrate product has the following specifications:

Factor XIII Concentrate (Human) or “Corifact™”	
Parameter	Specification
Albumin	6 - 10 mg/mL
Appearance	Colorless to slightly yellowish, slightly opalescent
Dissolution time	-(b)(4)-
Glucose	4 - 6 mg/mL
------(b)(4)--- protein	------(b)(4)---
------(b)(4)--- protein	------(b)(4)---
pH value	------(b)(4)---
Protein	6 - 16 mg/mL
Purity	------(b)(4)-----
Residual moisture	---(b)(4)---
Sodium chloride	7 - 11 mg/mL
Abnormal toxicity	Specifications CFR/---(b)(4)---
Potency	50 – 80 IU/mL
Pyrogens	Specification 21 CFR 610.13/---(b)(4)---
------(b)(4)-----	------(b)(4)-----
Sterility	Specification CFR/---(b)(4)--- (no growth)

Further review of the product specifications and stability data are deferred to the product office.

CSL states that the shelf life of Corifact™ is 6 months when stored at 2-8°C. Within the expiration date this product may be stored at room temperature (max. 25°C), not to exceed a cumulative storage period of 6 months.

CSLB provides Factor XIII Concentrate (Human) as a packaged kit. The kit includes a 30 ml (b)(4) clear glass vial of lyophilized Factor XIII Concentrate (Human) that is packaged in opaque packaging material to protect the lyophilized product from light. The Factor XIII vial is manufactured by ------(b)(4)-----
 ---. After filling and lyophilization, the vial is stoppered with a ------(b)(4)----- grey colored -----(b)(4)---- stopper (------(b)(4)-----). The stoppered vial is sealed with a combination aluminum crimp cap. CSLB states in the submission that “all these components contain no latex” and provided a product insert label that states “no latex.” Although the ------(b)(4)----- for this vial stopper that was reviewed in the -----

----(b)(4)----- does not contain natural rubber latex, -----
----- (b)(5)-----
----- After
reconstitution with a 20 mL vial of Sterile Water for Injection, USP, the solution contains 50-
80 IU/mL of Factor XIII. (In the final packaging CSLB provides a sterile filter transfer device;
manufactured by -----(b)(4)-----). The Mix2 Vial
filter transfer set is provided to allow for needless transfer of diluent and filtering of the
reconstituted product before it is withdrawn into a syringe. The Mix2 Vial filter transfer set is
a 510(k) cleared device K031861 that is currently approved for other CSLB products such as
Beriate P. (In Section 3.2.R.3-2 of the submission, CSLB stated that in addition to the testing
performed by the supplier that is reviewed on the Certificate of analysis, they test the following
parameters for each delivery of the Mix2Vial; identity; (----- (b)(4)-----), general
design, and performs a practice test with the filter. In addition to their supplier auditing, CSLB
performs (b)(4) testing to evaluate this device for ----- (b)(4)-----
-----). (CSLB provided data for Mix 2 vials that demonstrated
passing results for ----- (b)(4)-----.)

Conclusion: CSLB has provided an adequate description of the final Factor XIII product and
evidence of appropriate incoming specifications, auditing, and verification testing for the Mix2
vial.

MANUFACTURERS

The manufacture of Factor XIII Concentrate (Human) starting from plasma to the Factor XIII
final product is performed at:

CSL Behring GmbH (US License Number: 1765)

Emil-von-Behring-Str. 76
35041 Marburg, Germany

The manufacture of the Human Albumin (b)(4) Excipient used for Factor XIII Concentrate
(Human) was approved in ----- (b)(4)-----). The manufacturing site for the Human
Albumin (b)(4) is:

----- (b)(4)-----
----- (b)(4)-----
----- (b)(4)-----
----- (b)(4)-----

TESTING LABORATORIES

In-process testing during drug substance production as well as testing of the final product are
carried out at:

CSL Behring GmbH

Emil-von-Behring-Strasse 76
35041 Marburg, Germany

Contract Testing Laboratory

----- (b)(4)-----

----- (b)(4) -----
---- (b)(4) ----
----- (b)(4) -----
----- (b)(4) -----
----- (b)(4) -----
---- (b)(4) ----
---- (b)(4) ----
----- (b)(4) -----
----- (b)(4) -----
----- (b)(4) -----
- (b)(4) -

Contract testing laboratories include the following:

1. ----- (b)(4) -----
----- (b)(4) -----
2. ----- (b)(4) -----

----- (b)(4) -----

----- (b)(4) -----

SITE DESCRIPTION

CSLB will manufacture Factor XIII at their currently approved facility in Marburg, Germany. This location uses (b)(4) buildings ----- (b)(4) ----- on (b)(4) distinct manufacturing sites (----- (b)(4) -----) to execute the entire manufacturing process. - (b)(4) - these sites are approved for campaign manufacture of multiple plasma derived US and non US licensed products. Many of the US and non US product manufacturing steps are identical. The difference between these products is that the US licensed products are sourced from US plasma donors.

Building (b)(4) at the Marburg (b)(4) facility is the site for -----

----- (b)(4) -----

-----.

The (b)(4) buildings used in the manufacturing process are -----
----- (b)(4) -----
----. Facilities used for the manufacture and testing of Factor XIII are summarized in the table below:

Building / Site	Floor	Manufacturing Activity
-----------------	-------	------------------------

Building / Site	Floor	Manufacturing Activity
----- (b)(4) ----- -----	(b)(4)	----- ----- ----- (b)(4) ----- -----
	(b)(4)	----- ----- ----- (b)(4) ----- -----
	(b)(4)	----- (b)(4) -----
----- (b)(4) ----- -----	(b)(4)	----- (b)(4) -----
	(b)(4)	----- (b)(4) -----
----- (b)(4) ----- -----	(b)(4)	----- (b)(4) ----- -----
	(b)(4)	----- ----- ----- (b)(4) ----- -----
	(b)(4)	----- ----- (b)(4) ----- -----
----- (b)(4) ----- -----	(b)(4)	----- ----- ----- (b)(4) ----- ----- -----
	(b)(4)	----- ----- (b)(4) ----- -----
----- (b)(4) ----- -----	(b)(4)	----- ----- ----- (b)(4) ----- ----- -----
	(b)(4)	----- ----- (b)(4) ----- -----
----- (b)(4) ----- -----	(b)(4)	----- ----- ----- (b)(4) ----- ----- -----
Building / Site	Floor	Testing
----- (b)(4) ----- -----	(b)(4)	----- (b)(4) ----- -----
----- (b)(4) ----- -----	(b)(4)	----- (b)(4) -----
----- (b)(4) ----- -----	(b)(4)	----- (b)(4) -----
----- (b)(4) ----- -----	(b)(4)	-- (b)(4) --
----- (b)(4) ----- -----	(b)(4)	-- (b)(4) --

These (b)(4) buildings at the Marburg ----- (b)(4) ----- sites are currently approved for manufacture of other US licensed products, such as: Fibrinogen Active Substance (STN 125356), Thrombin Active Substance (STN 125357), Vivaglobin[®] (Immune Globulin, STN 125115), Humate-P[®] (AHF/von Willebrand, STN 103960), RiaSTAP[®] (Fibrinogen Concentrate, STN 125317), and BERINERT[®] (C1 Esterase Inhibitor, STN 125287).

In the submission CSLB provided descriptions and the flow diagrams for product, equipment and materials, personnel, airflow and pressurization for all buildings. Data not found in flowcharts for equipment, classification of adjoining rooms or pressure differentials were adequately addressed in the descriptions of these systems. The flow patterns described continue to appear appropriate and do not seem to promote any contamination or cross-contamination situations.

Conclusion: CSLB has provided an adequate description of the facilities, airflow and flow of personnel, materials and equipment used in production. There do not appear to be any changes from those approved for their currently licensed products.

Environmental Impact Assessment

CSLB requested a categorical exclusion based upon 21 CFR § 25.31 (c) which allows a categorical exclusion for an action on an application for marketing approval for marketing of a biologic product for substances that occur naturally in the environment when the action does not alter significantly the concentration or distribution of the substance, its metabolites, or degradation products in the environment. A separate categorical exclusion waiver memo has been approved and placed in the file.

MANUFACTURING PROCESS OVERVIEW

CSL provided detailed descriptions of the manufacturing steps in Section 3.2.S.2.2-1 of the submission. The following is an outline of the steps in CSL's manufacturing procedures for Factor XIII identified by their production codes;

----- (b)(4) -----

----- (b)(4) -----

----- (b)(4) -----

----- (b)(4) -----

----- (b)(4) -----

----- (b)(4) -----

----- (b)(4) -----

-(b)(4)-

-(b)(4).

-(b)(4).

(b)(4): QC Release testing

----- (b)(4) ----- tested for final release and can be clearly differentiated by the individual batch numbers (batch code explanation was provided in Section 3.2.S.2.2-3).

Conclusion: CSLB provided an adequate description of the Factor XIII manufacturing process steps. Further review of the product specifications and stability data are deferred to the product office.

Factor XIII- Batch and Scale

-(b)(4).

Conditions of use and reuse of material

----- (b)(4) -----
-----:

1 page redacted (b)(4)

CSLB based their process validation on formal studies of their European product, a risk analysis of the critical process steps, an evaluation of the parameters for the critical process control steps, multiple full scale investigation reports and the process simulations performed for Factor XIII. Process validation studies were conducted at full-scale specifically assessing the ability of -----(b)(4)-----

----- Separate validation reports were provided for the lyophilization process, -----(b)(4)-----

----- Full-scale studies were conducted to evaluate the -----(b)(4)----- levels throughout the production process of Factor XIII up to the lyophilized final product and to identify the major potential protein impurities (residual plasma proteins and non-protein impurities such as auxiliary substances) up to the drug product. In addition, product sterility was verified by process simulation using sterile nutrient medium (media fill studies).

Based on CSLB's risk assessment described below, the entire drug product production process for Factor XIII was validated at full scale with manufacturing batches that were produced with Process Control Parameters (PCPs) set to the target values. All critical PCPs and in-process tests were evaluated.

Critical Process Steps from Risk Analysis

CSLB validated their production process for Factor XIII based on the following critical process steps. These critical process steps were identified by a risk analysis approach:

- -----(b)(4)-----
- -----(b)(4)-----
- -----(b)(4)-----
- -----(b)(4)-----
- -----(b)(4)-----
- -----(b)(4)-----
- -----(b)(4)-----
- -----(b)(4)-----
- -----(b)(4)-----
- -----(b)(4)-----
- -----(b)(4)-----
- -----(b)(4)-----
- -----(b)(4)-----
- -----(b)(4)-----
- -----(b)(4)-----
- -----(b)(4)-----
- -----(b)(4)-----

Section 2.3.S. Control of Critical Steps and Intermediates

CSLB evaluated the critical process control parameters (PCPs) and provided risk assessment reports in the submission for the manufacture of Factor XIII. In Table 7 of this section CSLB 3 pages redacted (b)(4)

----- (b)(4) -----	--- (b)(4) ---	----- (b)(4) -----	---- (b)(4) ----
----- (b)(4) -----	--- (b)(4) ---	----- (b)(4) -----	--- (b)(4) ---
----- (b)(4) -----	----- (b)(4) -----	----- (b)(4) -----	--- (b)(4) ---
----- (b)(4) -----	--- (b)(4) ---	----- (b)(4) -----	----- (b)(4) -----
----- (b)(4) -----	--- (b)(4) ---	----- (b)(4) -----	--- (b)(4) ---
----- (b)(4) -----	--- (b)(4) ---	----- (b)(4) -----	--- (b)(4) ---

In Section 3.2.P.5.1 CSLB listed the following final product release testing:

Specifications for Final Product Testing				
Product quality attribute		Specification	Testing method	Justification
Practicability and organoleptic properties	Dissolution time	--- (b)(4) --	Dissolution of the solid and visual control	Manufacturing experience
	Appearance	Colorless to slightly yellowish, slightly opalescent solution		
----- (b)(4) ----- protein		----- (b)(4) -----	----- (b)(4) -----	Manufacturing experience. Part of identity testing according to 21 CFR 610.14
----- (b)(4) ----- protein		----- (b)(4) -----	----- (b)(4) -----	-(b)(4)-. and Part of identity testing according to 21 CFR 610.14
Purity		----- (b)(4) -----	----- (b)(4) -----	Manufacturing experience
Specifications for Final Product Testing (continued)		Specifications for Final Product Testing (continued)	Specifications for Final Product Testing (continued)	Specifications for Final Product Testing (continued)
Protein		6 – 16 mg/mL	----- (b)(4) -----	Total protein

Specifications for Final Product Testing			
Product quality attribute	Specification	Testing method	Justification
		----- (b)(4) -----	content according to -(b)(4)-. includes all protein ingredients. The range reflects process and assay variability and was based on historical data.
----- (b)(4) -----	----- (b)(4) -----	----- (b)(4) -----	-(b)(4)-.
Albumin	6 – 10 mg/mL	----- (b)(4) -----	Range reflects process and assay variability and was based on historical data.
Glucose	4 – 6 mg/mL	----- (b)(4) -----	Manufacturing experience
Sodium chloride	7 – 11 mg/mL	----- (b)(4) -----	Range reflects process and assay variability and was based on historical data
pH	----- (b)(4) -----	----- (b)(4) -----	(b)(4)
Residual moisture	(b)(4)	----- (b)(4) -----	Specification set according to manufacturing experience. Range reflects process variability and was based on historical data. Assay method according to -(b)(4)-
Potency	50 – 80 IU/mL	----- (b)(4) -----, Berichrom	Specification set according to manufacturing experience. Range reflects process variability and was based on historical data.
----- (b)(4) -----	----- (b)(4) -----	----- (b)(4) -----	-----

Specifications for Final Product Testing			
Product quality attribute	Specification	Testing method	Justification
			(b)(4)----- -----
Sterility	As specified in CFR/(b)(4)	Inoculation method in accordance with 21 CFR 610.12 and -(b)(4)-	CFR/(b)(4) No growth
Pyrogens	As specified in CFR/(b)(4)	Test in rabbits in accordance to 21 CFR 610.13(b) and (b)(4) Dose/kg body weight: 3.0 mL	CFR/ -(b)(4)-
Abnormal toxicity/General safety test	Specification CFR/(b)(4)	Test in accordance with 21 CFR 610.11 and USP	21 CFR 610.11 and (b)(4)
Identity: ----- ---(b)(4)----- -----	------(b)(4)----	----- ------(b)(4)----- -----	CFR

Conclusion: The release criteria for Factor III include appropriate tests for evaluation of potential contamination; appearance, pyrogenicity, and sterility testing. The review of the appropriateness of the release testing for product performance is deferred to the product office for final review.

Full Scale Process Validation Study PV-642-004-03

This full-scale process validation study completed in November 2009 was conducted by manufacturing three consecutive lots of Fibrogammin P 1250 U (Factor XIII) under routine conditions at full-scale to validate the effect of individual processing steps and holding times on particular process quality attributes. These steps included the -----
------(b)(4)-----

----- were validated at full-scale under the following “worst case” conditions;

- ------(b)(4)-----

- -----(b)(4)-----
- -----(b)(4)-----
- -----(b)(4)-----

- -----(b)(4)-----

- -----(b)(4)-----

In the review of the information for these three validation lots; ------(b)(4)-----
-----, it was noted that the study passes all pre-defined acceptance criteria which confirmed the maximum hold times evaluated throughout the production process. The filling investigative study verified that the filling process, including holding times and storage conditions, can reproducibly deliver a homogeneous lyophilized

active substance. The three consecutive full-scale batches of lyophilized active substance were manufactured in support of the lyophilization process using lyophilizer --(b)(4)-- which is located in building --(b)(4)--. Additionally, CSLB provided a report of their evaluation of -----(b)(4)----- levels throughout the manufacturing process and media fill studies. (The filling, lyophilization, and media fill studies that were performed for process validation are reviewed below.)

Conclusion: CSLB has provided multiple validation studies of the process steps and the overall manufacturing process for Factor XIII. This full scale process validation which was completed successfully in triplicate appears to include appropriate parameters and endpoints which demonstrate that this production process is well controlled. The final review of the process validation is deferred to the product office.

	-----	(b)(4)	(b)(4)	(b)(4)

The results for this study demonstrate that the ----- (b)(4) -----, sterility and pyrogen levels all met the acceptance criteria. -----

----- (b)(4) -----

----- gray ----(b)(4)---- rubber stopper in accordance with -----
----(b)(4)----- and a product color coding of both the aluminum crimp
cap with a punched hole and integrated polypropylene disc. The suppliers were listed and
letters of authorization for their Drug Master Files were provided in the submission. The 30 ml
glass -(b)(4)-- vial is supplied by the company -----
------(b)(4)----- vials
and CSLB products manufactured in the ------(b)(4)-----
-----.

The 32 mm -----(b)(4)--- lyophilization stopper is identified by the supplier (------(b)(4)----)
as model -----(b)(4)----- . In the review of ----(b)(4)----- dated July 10, 2007, the
formulation was noted to contain only -----(b)(4)----- which is a -----(b)(4)-----
formulation. The stopper formulation reviewed in this DMF does not contain natural rubber
latex. This lyophilization stopper is currently approved for RiaStap (BLA 125317) since
February 2010 and Fibrinogen 2G (December 2010) and will use the -----
------(b)(4)-----
----- . Quality control measures are routinely used to ensure the consistent quality of
the packaging components and include supplier audits, inspection program for incoming
packaging components and materials and receipt of certificates of analysis from the vendor and
appropriate identification testing by CSLB. The stopper has been tested according to-----
------(b)(4)----- , although the firm did not include any -----(b)(4)-----
test data to support the use of the -----(b)(4)----- stopper material with Factor XIII, this
information has been reviewed and approved during the review of RiaSTAP in BLA 125317.
Since the RiaSTAP document is not electronic, the memorandum reviewing this information in
the EDR was referenced. The review of the -----(b)(4)----- data for this stopper was
found acceptable for the RiaSTAP BLA submission.

After lyophilization in (b)(4), the stoppered Factor XIII vial is sealed with a combination
aluminum crimp cap, -----(b)(4)----- for labeling and
packaging. Final packaging is in opaque outer packaging for light protection since the vial is
clear glass. In the submission CSLB provided evidence of quality control measures in place
for ongoing evaluation of the quality of the container closure from receipt through manufacture
of the final product. In addition to Factor XIII, the final kit packaging also contains a 20 ml
vial of Sterile Water for Injection, USP, alcohol swabs, and a Mix2 Vial filter transfer set
which allows for needleless transfer of diluent and filtering of the reconstituted product before it
is withdrawn into a syringe at the point of care. The Mix2 Vial filter transfer set is a 510(k)
cleared device K031861 that is currently approved for other CSLB products that are
reconstituted prior to use with Sterile Water for Injection, USP such as Humate P.)

CSLB states in the submission that “all these components contain no latex” and provided a
product insert label that states “no latex.” Although the -----(b)(4)----- for
this vial stopper that was reviewed in the -----(b)(4)----- does not
contain natural rubber latex, -----

------(b)(5)-----

Conclusion: CSLB has provided an adequate description of the container closure systems and final packaging of the Factor XIII product.

“Compatibility of Mix2 Vial Device with Fibrogammin P”

CSLB performed this compatibility study for the use of the Mix2Vial transfer device with Fibrogammin P1250 U/ Factor XIII during August- September 2008. This report describes testing to evaluate the ability of this needless device to transfer 20 ml of the Sterile water for Injection, USP provided as diluent for the product in the final packaging and filter the reconstituted product prior to removal from the vial by syringe. Testing by their QC labs included -----

----- (b)(4) -----
----- Testing was also performed -----
----- (b)(4) ----- (only for test purposes since the product is used immediately after reconstitution.) The results provided in the report showed that all vials were reconstituted within --(b)(4)-- which met the ---(b)(4)-- criteria and appearance requirements for the reconstituted product in solution; colorless, clear to slightly opalescent. Although the results indicate that the ----- (b)(4) ----- met the required criteria in (b)(4) for Factor XIII, the review of the product parameters is deferred to the product office for final determination of the compatibility of this transfer device with Factor XIII.

Conclusion: CSLB has demonstrated the ability to use the Mix2Vial needless transfer device to reconstitute Factor XIII within the recommended dissolution time.

CONTAINER CLOSURE VALIDATION

Container Closure Integrity---(b)(4)---

----- (b)(4) -----

1 page redacted (b)(4)

------(b)(4)-----
------. The approval of this submission without this data for container closure is currently supported by the lot release and stability testing which do not indicate any failures with final test parameters for the product activity, residual moisture results are well within the ≤residual moisture, findings of “no growth” on sterility testing, and no changes in the appearance of the final lyophilized product.

Packaging and Labeling Process

Packaging and labeling occurs in Building (b)(4) on the (b)(4) floor. CSLB has not described any changes in their approved packaging and labeling process. All labels, leaflets and cartons are transferred from room ----(b)(4)----- to the respective labeling or packaging line. This area has been evaluated in previous inspections and approved for use with Fibrinogen 2G, RiaStap, and other US licensed products. CSLB also provided information on the quality control measures are routinely used to ensure consistent quality of the packaging components and include:

- Supplier audits,
- Inspection program for incoming packaging components and materials, and

Receipt of certificates of analysis from the vendor and performance of appropriate identification tests.

Conclusion: CSLB is using the same packaging and labeling process for Factor XIII that has been approved for their currently licensed products such as Fibrinogen 2G.

Shipping Validation

“ Transport Validation of Finished Product Between ZLB Behring Manufacturing Sites in Marburg, Germany and Kankakee, Illinois, USA in the Temperature Range of -- (b)(4)----”

CSLB provided this April 2005 shipping validation study which has been reviewed and approved for US licensed products. CSLB employs validated specific freight forwarders (i.e., shipping / logistical company) to deliver products -----

----- (b)(4) -----

the temperature graphs obtained during this validation that demonstrate their ability to meet their defined parameters for shipping.

Conclusion: CSLB has provided appropriate data to validate transport and shipping of Factor XIII.

EQUIPMENT

CSLB provided a March 2010 list of their main equipment list and validations for each building used in manufacture of Factor XIII. It is noted that the validations provided in this submission are consistent with the information reviewed and approved for use with the

following licensed products; Fibrinogen Active Substance 2G, Thrombin Active Substance, RiaSTAP[®], Humate-P[®], and Vivaglobin[®]:

----- (b)(4) -----

-----.

Facility Cleaning of Buildings -----(b)(4)-----

Facility cleaning of rooms is carried out according to detailed schedules and procedures, using validated disinfectant agents (-----(b)(4)-----) and defined cleaning intervals. Cleaning is monitored by an environmental monitoring program.

Conclusion: CSLB continues to follow their facility cleaning processes which have been approved for the multiple licensed US products manufactured in these areas.
