Health Care Institute

Disclosures

I am an employee of Harvard Pilgrim Health Care Institute.

I currently receive funding from FDA, NIH, PCORI, BBCIC, IMEDS, GSK, and Pfizer.

I am the inventor of PopMedNet, an open source software application to support distributed health data networks.

40 ZETTABYTES

(43 TRILLION GIGABYTES) of data will be created by 2020, an increase of 300 times from 2005

6 BILLION PEOPLE have cell phones

WORLD POPULATION: 7 BILLION

Volume

SCALE OF DATA

It's estimated that **2.5 QUINTILLION BYTES** (2.3 TRILLION GIGABYTES) of data are created each day

Most companies in the U.S. have at least **100 TERABYTES** (100,000 GIGABYTES) of data stored

The New York Stock Exchange captures

1 TB OF TRADE INFORMATION during each trading session

Modern cars have close to **100 SENSORS** that monitor items such as fuel level and tire pressure

Velocity

ANALYSIS OF STREAMING DATA

By 2016, it is projected there will be

18.9 BILLION NETWORK CONNECTIONS

—almost 2.5 connections per person on earth

The FOUR V's of Big Data

From traffic patterns and music downloads to web history and medical records, data is recorded, stored, and analyzed to enable the technology and services that the world relies on every day. But what exactly is big data, and how can these massive amounts of data be used?

As a leader in the sector, IBM data scientists break big data into four dimensions: **Volume, Velocity, Variety and Veracity**

Depending on the industry and organization, big data encompasses information from multiple internal and external sources such as transactions, social media, enterprise content, sensors and mobile devices. Companies can leverage data to adapt their products and services to better meet customer needs, optimize operations and infrastructure, and find new sources of revenue.

By 2015, **4.4 MILLION IT JOBS** will be created globally to support big data, with 1.9 million in the United States

As of 2011, the global size of data in healthcare was estimated to be

150 EXABYTES (187 BILLION GIGABYTES)

30 BILLION PIECES OF CONTENT are shared on Facebook every month

By 2014, it's anticipated there will be **420 MILLION WEARABLE, WIRELESS HEALTH MONITORS**

4 BILLION+ HOURS OF VIDEO are watched on YouTube each month

400 MILLION TWEETS are sent per day by about 200 million monthly active users

Variety

DIFFERENT FORMS OF DATA

1 IN 3 BUSINESS LEADERS don't trust the information they use to make decisions

27% OF RESPONDENTS

in one survey were unsure of how much of their data was inaccurate

Veracity

UNCERTAINTY OF DATA

Poor data quality costs the US economy around **\$3.1 TRILLION A YEAR**

Sources: McKinsey Global Institute, Twitter, Cisco, Gartner, EMC, SAS, IBM, MEFTEC, QAS

Mini-Sentinel and Regulatory Science — Big Data Rendered Fit and Functional

Bruce M. Psaty, M.D., Ph.D., and Alasdair M. Breckenridge, M.D.

N Engl J Med 2014; 370:2165-2167 | June 5, 2014 | DOI: 10.1056/NEJMp1401664

[Metrics](#)

In medicine, “big data” come in many forms. With the financial incentives provided by Medicare and Medicaid for the “meaningful use” of electronic health records (EHRs), the quantity of electronic medical data has expanded rapidly. Simultaneously, genomewide association studies funded by the National Heart, Lung, and Blood Institute have produced data sets with millions of genetic variants for each participant, encouraged the development of consortia with hundreds of thousands of study participants, and resulted in discoveries about the genetic origins of human health and disease.

Sentinel's charge

Assess the use, safety, and effectiveness of regulated medical products by using electronic healthcare data plus other resources

Create data, informatics, and methodologic capabilities to support these activities

Speedily!

What does “Big Data” Offer?

- **Breadth** – large numbers of individuals get us closer to the underlying source population – *potential reduction in selection bias?*
- **Depth** – increasing amount of data on each individual increases the chance that we will have measures of likely confounders – *potential reduction in information bias?*
- **Diversity** – different types of data offer the potential to “cross check” findings for any particular data source – *potential to enhance control for residual bias and/or improve generalizability?*

What is needed to generate actionable evidence?

- Adequate data
 - Medical Product Exposure
 - Health Outcomes of Interest
 - Confounders
- Appropriate method
- To answer the question of interest
- To a satisfactory level of precision

What is unique about Big Data for pediatrics?

- Age by itself is not a barrier (if date of birth is known)
- Issues around exposure to medical products during pregnancy and birth outcomes
 - Complex to link moms and babies to assess birth outcomes
 - Health plan data challenges in days after birth
 - Coded for the mom or baby?
- Unique patterns of care?
 - Critical information dispersed (no data source has a clear view)
 - Hospital, pediatrician, insurer, birth registry, vaccine registry
 - Do kids see more specialists leading to more data dispersion?
 - Care at school?
- Regulatory constraints/ research with minors

Data and scientific partners

Scientific partners

An ideal distributed network should...

- Accommodate many data holders' data
- Incorporate new kinds of data as they become available
- Maximize local control of data and uses
- Minimize data exchange
- Include local experts in study design and interpretation
- Allow a study protocol to be implemented identically and efficiently across the network
- Support standardized, reusable components
- Generate actionable information

An ideal distributed network should...

- Accommodate many data holders' data
- Incorporate new kinds of data as they become available
- Maximize local control of data and uses
- Minimize data exchange
- Include local experts in study design and interpretation
- **Allow a study protocol to be implemented identically and efficiently across the network**
- **Support standardized, reusable components**
- **Generate actionable information**

These needs lead to a common data model

- Standard data structure allows
 - Partners to execute identical distributed programs locally
 - Development of reusable tools
- Based on Guiding Principles
- Focused on most relevant data domains

Sentinel CDM Oversight

- A strong coordinating center manages the data partner network that actively participates in the creation, implementation, updating, maintenance, enhancement, and use of the Sentinel CDM (SCDM)
- The SCDM ...requires that data comparable in **format and meaning** are stored at all sites

For evidence generation and decision making:

Big Data needs Big Curation and Big Expertise

Select Data Model Guiding Principles

- The SCDM is able to incorporate new data types and data elements as future needs indicate
- The SCDM design is transparent, intuitive, well documented and easily understood by analysts, investigators, and stakeholders. It is easy to use by experienced analysts and investigators; special skills or knowledge beyond those commonly found among pharmacoepidemiologist and analysts should not be necessary.
- The SCDM enables interoperability with appropriate evolving healthcare coding standards
- The SCDM captures values found in the source data; any mapping to standard vocabularies are transparent
- Calculated variables should not be stored in the SCDM

SCDM key considerations

- Inclusion of a variable does not imply completeness
- Completeness may vary by source and over time
- Availability of data in the source system does not mean it is usable for research
 - **Especially in a multi-site environment**
- Maintaining standardization is an ongoing and iterative process

For evidence generation and decision making:

Big Data needs Big Curation and Big Expertise

Sentinel Data Partners

Hospital Corporation of America™

MASSACHUSETTS

Centers for Medicare & Medicaid Services

Starting 2017

Numerous data elements are available

Demographics and Medical Encounters

Enrollment	Demographic	Dispensing	Encounter	Diagnosis	Procedure
Person ID	Person ID	Person ID	Person ID	Person ID	Person ID
Enrollment start & end dates	Birth date	Dispensing date	Service date(s)	Service date(s)	Service date(s)
Drug coverage	Sex	National drug code (NDC)	Encounter ID	Encounter ID	Encounter ID
Medical coverage	ZIP code	Days supply	Encounter type & provider	Encounter type & provider	Encounter type & provider
Medical record availability	Etc.	Amount dispensed	Facility	Diagnosis code & type	Procedure code & type
			Etc.	Principal discharge diagnosis	Etc.

Clinical

Lab Result	Vital Signs
Person ID	Person ID
Result and specimen collection dates	Measurement date and time
Test type, immediacy & location	Height and weight
Logical Observation Identifiers Names and Codes (LOINC ®)	Diastolic & systolic BP
Test result & unit	Tobacco use & type
Etc.	Etc.

Registry

Death	Cause of Death	State Vaccine
Person ID	Person ID	Person ID
Death date	Cause of death	Vaccination date
Source	Source	Admission Type
Confidence	Confidence	Vaccine code & type
Etc.	Etc.	Provider
		Etc.

Inpatient

Inpatient Pharmacy	Inpatient Transfusion
Person ID	Person ID
Administration date and time	Administration start and end date and time
Encounter ID	Encounter ID
National Drug Code (NDC)	Transfusion administration ID
Route	Transfusion product code
Dose	Blood Type
Etc.	Etc.

Sentinel distributed database*

- Populations with well-defined person-time for which most medically-attended events are known
- 425 million person-years of observation time
- 43 million people currently accruing new data
- 5.9 billion pharmacy dispensings
- 7.2 billion unique medical encounters
- 42 million people with at least one laboratory test result

<https://www.sentinelinitiative.org/sentinel/snapshot-database-statistics>

* As of January 2017

Three ways to address questions

Rapid Analyses

Custom Programs

- Analysis as specified
- Custom inputs, custom output
- Longer execution

Routine Analytic Framework (RAF)

- Off-the-shelf query “templates”
- Standard inputs, standard output
- Quick execution

RAF + custom code

- Hybrid approach: custom code leveraging RAF
- Standard inputs, custom output

Rapid Response Requires Robust Data Quality Assurance – In Advance of Its Use

The database is dynamic – updates overwrite the preceding data!

Data Partner Source Database Structure

Transformed database in Sentinel CDM Format

Timeframe of Data in Database

Data Delivery 1

Compliance Checks

Level 1: Completeness, validity, accuracy

Level 2: Cross-variable and cross-table integrity

Judgment Call Checks

Level 3: Trends: consistency

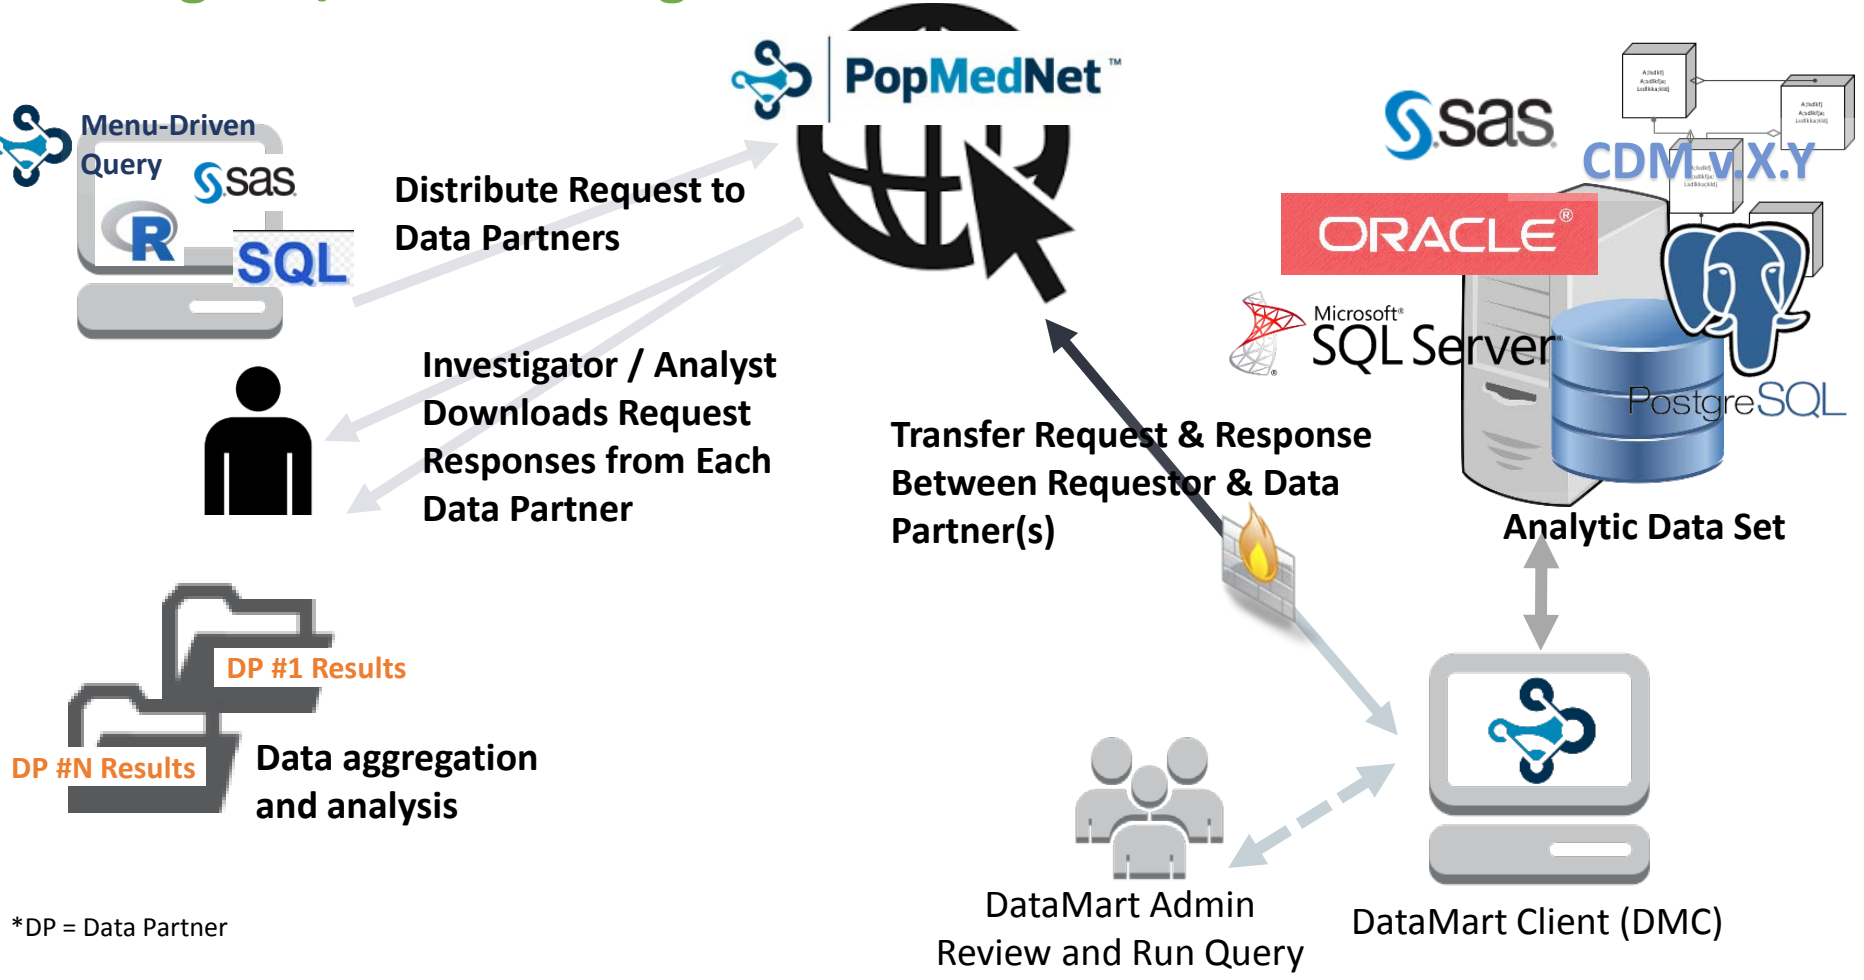

Level 4: Logical: plausibility, convergence

Sentinel quality assurance statistics

- The QA team (six people) reviews ~50 data updates per year from 17 Data Partners
- Since 1/1/2016, the dataset has needed to be re-refreshed and QA package re-run 16 times to fix an issue
- In the latest data deliveries from the 5 largest DPs, 25 checks required DP follow-up
 - 22 of the 25 were Level 3 checks

Investigator/Coordinating Center

Data Partner N

*DP = Data Partner

Examples of Sentinel studies

- Rotavirus and intussusception
- Mother-infant cohort to monitor vaccine safety during pregnancy
- Length of enrollment among adolescents
- Medication use during pregnancy
 - Use of antiemetic drugs
 - TDAP
- Blood transfusion during pregnancy
- Mobile App: collect data from patients

FDA Safety Communication — June 13, 2013

FDA Releases Final Study Results of a Mini-Sentinel Postlicensure Observational Study of Rotavirus Vaccines and Intussusception

FDA Approves Required Revised Labeling for RotaTeq Based on the Study Results

Developing a mother-infant cohort in Sentinel's PRISM Program as a resource to monitor the safety of vaccine use during pregnancy

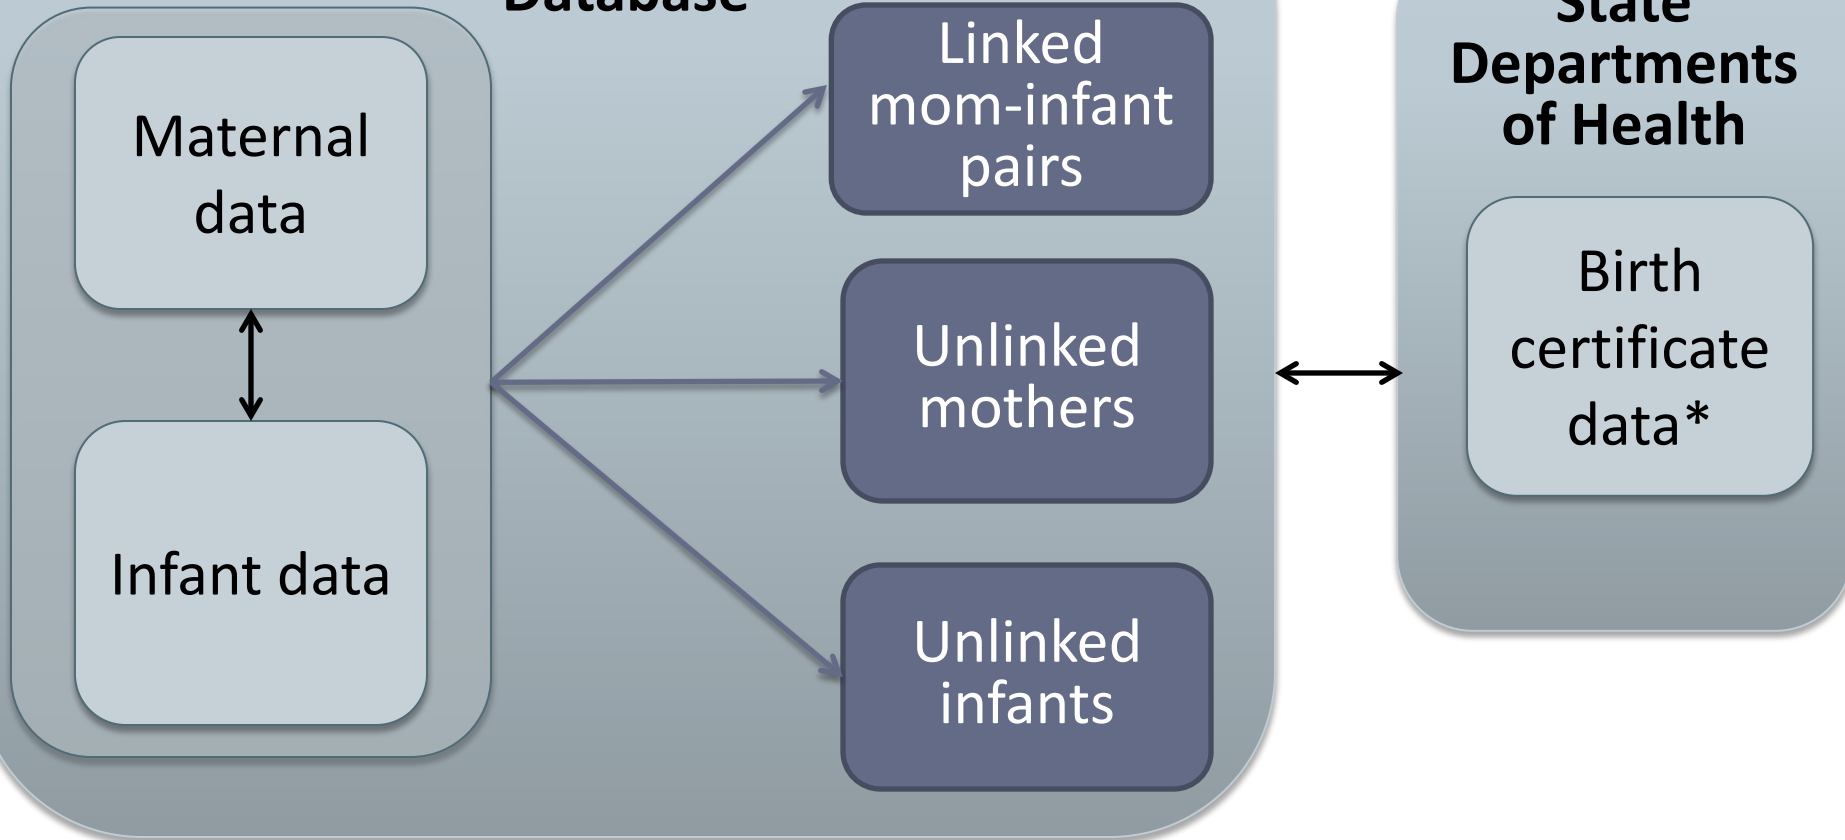

Alison Kawai¹, ScD, Susan Andrade², ScD, Robert Rosofsky³, MA, Lauren Zichittella¹, MPH, Katherine Haffenreffer¹, BS, Cheryl Walraven⁴, PhD, MSW, Kevin Haynes⁵, PharmD, MSCE, Mano Selvan⁶, PhD, Anita M. Loughlin⁷, PhD, Azadeh Shoaibi⁸, PhD, MS, MHS, Steven Anderson⁸, PhD, MPP, Grace Lee^{1,9}, MD, MPH

¹ Department of Population Medicine, Harvard Medical School and Harvard Pilgrim Health Care Institute; ² Meyers Primary Care Institute; ³ Health Information Systems Consulting; ⁴ Aetna Inc.; ⁵ HealthCore Inc.; ⁶ Comprehensive Health Insights Inc; ⁷ OptumInsight Inc; ⁸ Center for Biologics Evaluation and Research, Food and Drug Administration; ⁹ Boston Children's Hospital

Objective

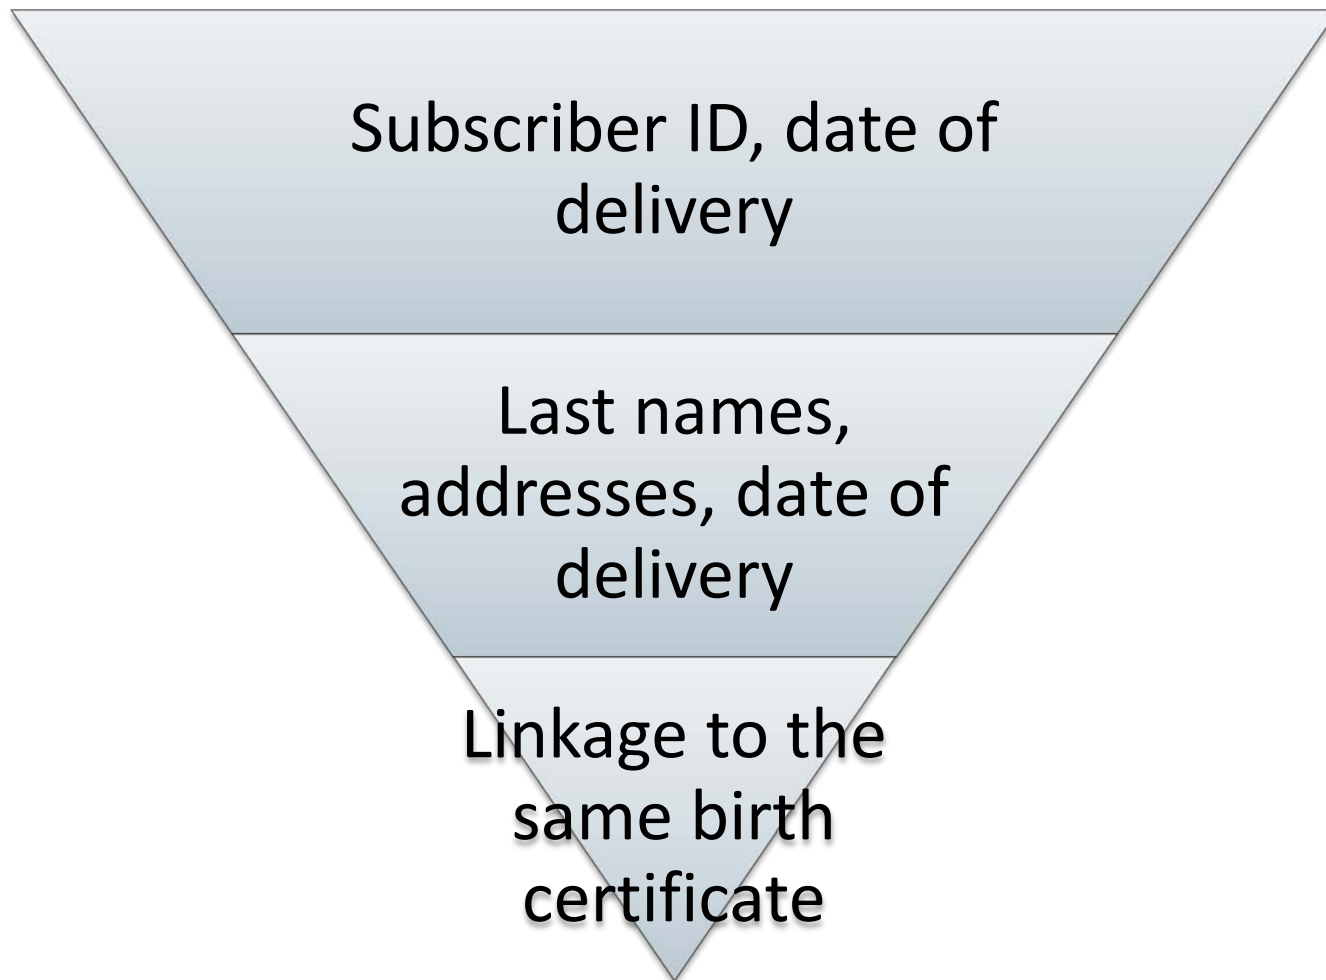

- To develop capabilities to assess **infant outcomes** following **maternal vaccination** within Sentinel's vaccine safety system
 - Post-licensure Rapid Immunization Safety Monitoring Program (PRISM)
- To develop a **mother-infant cohort**
- To develop and validate a **claims-based gestational age algorithm** within the mother-infant cohort

Claims Data in Sentinel Distributed Database

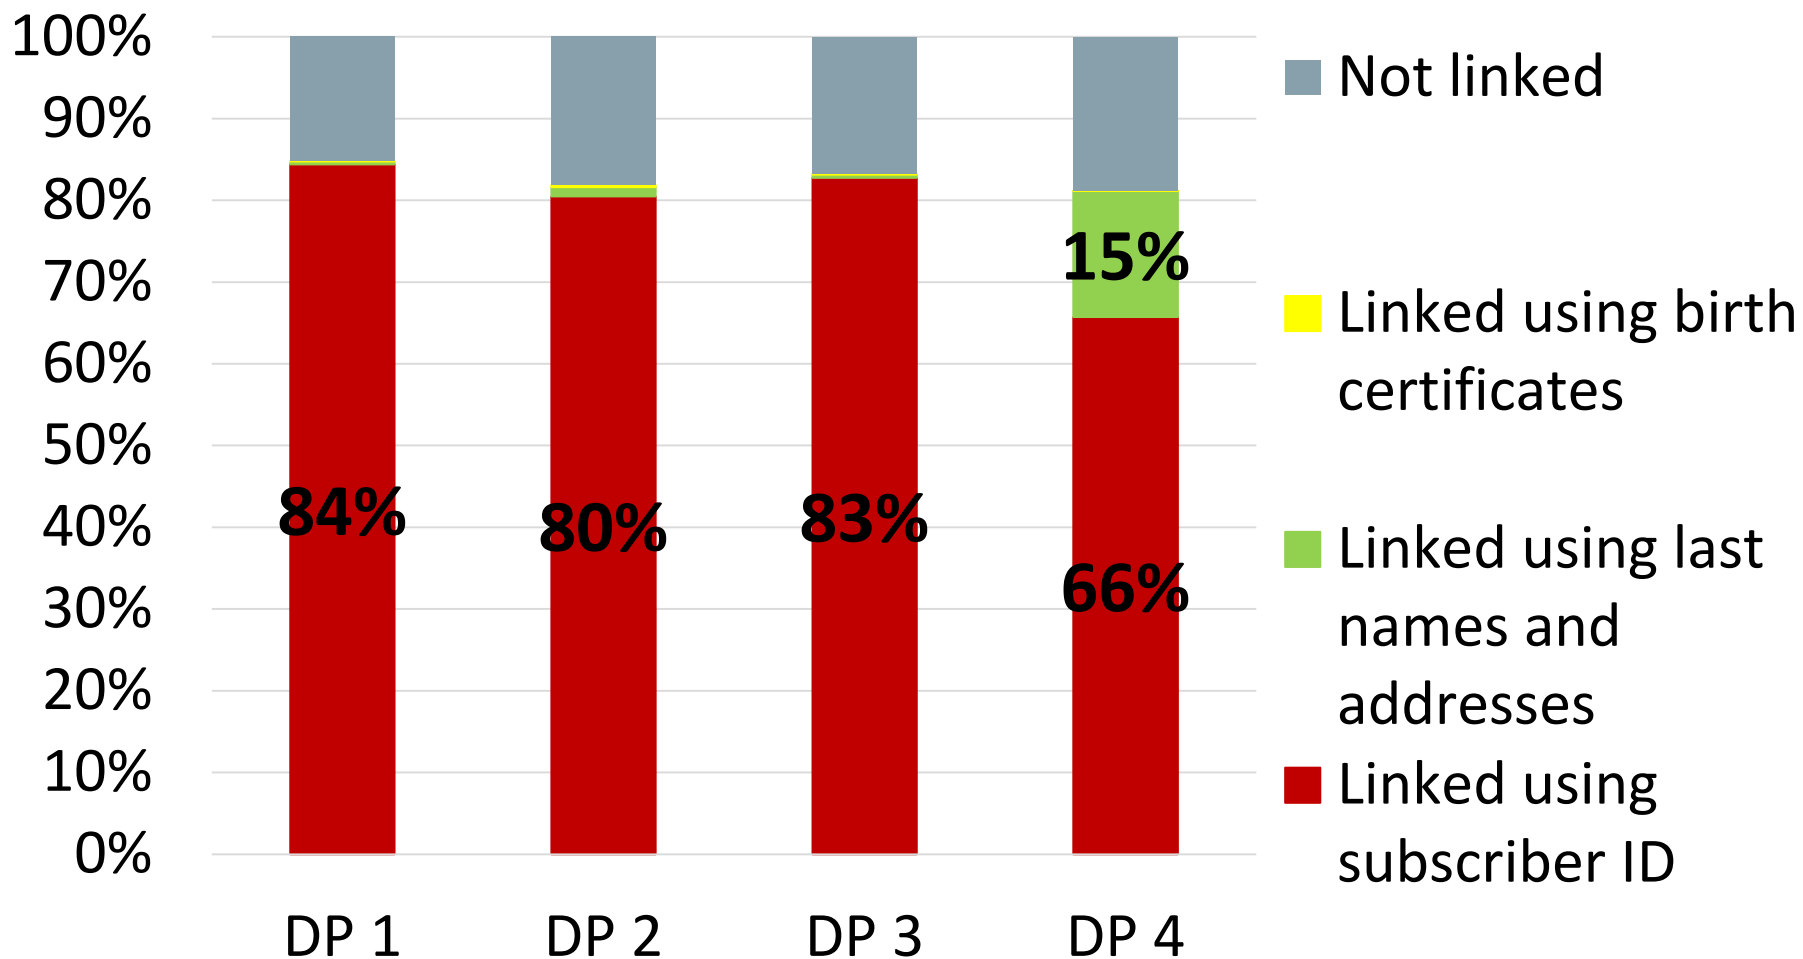

*Birth certificates available for 9 states

Methods to link deliveries to infants

Percent deliveries linked to infants (N=651,607)

Validation of pregnancy start algorithm*

N=223 mother-infant pairs

Veracity

*A total of 313 mother-infant pairs were chart-reviewed

Conclusions

- Successfully linked mothers to infants in 4 large Sentinel Data Partners
- Demonstrated the validity of a claims-based algorithm for pregnancy start
- Supports the feasibility of assessing infant outcomes following maternal vaccination exposures
- Further validation of electronic data elements is needed

Length of enrollment after HPV vaccination

- **Big data needs enough data for study needs** Longitudinality...
- 1.94 million new users with 1 year pre exposure and 6 months post exposure enrollment
- 927,000 with 1 year pre exposure and 2 years post exposure enrollment

	New HPV Users
Minimum of 365 Days of Enrollment Before Index	
6-Month Enrollment Span After Index	1,940,014
12-Month Enrollment Span After Index	1,558,125
18-Month Enrollment Span After Index	1,178,460
24-Month Enrollment Span After Index	927,484
36-Month Enrollment Span After Index	569,552

PHARMACOEPIDEMIOLOGY AND DRUG SAFETY 2017; 26: 592–596

Published online 21 February 2017 in Wiley Online Library (wileyonlinelibrary.com) DOI: 10.1002/pds.4185

BRIEF REPORT

Antiemetic use among pregnant women in the United States: the escalating use of ondansetron

Lockwood G. Taylor^{1*} , Steven T. Bird¹, Leyla Sahin¹, Melissa S. Tassinari¹, Patty Greene¹, Marsha E. Reichman¹, Susan E. Andrade², Katherine Haffenreffer³ and Sengwee Toh³

Use of antiemetic drugs among live birth pregnancies in the Sentinel Distributed Database, 2001-2014^{a,b}

^a Dashed lines for oral and injection ondansetron form represent a portion of all total ondansetron use as shown by the solid purple line. Summation of oral and injection utilization sums to greater than total ondansetron use since some women received both products.

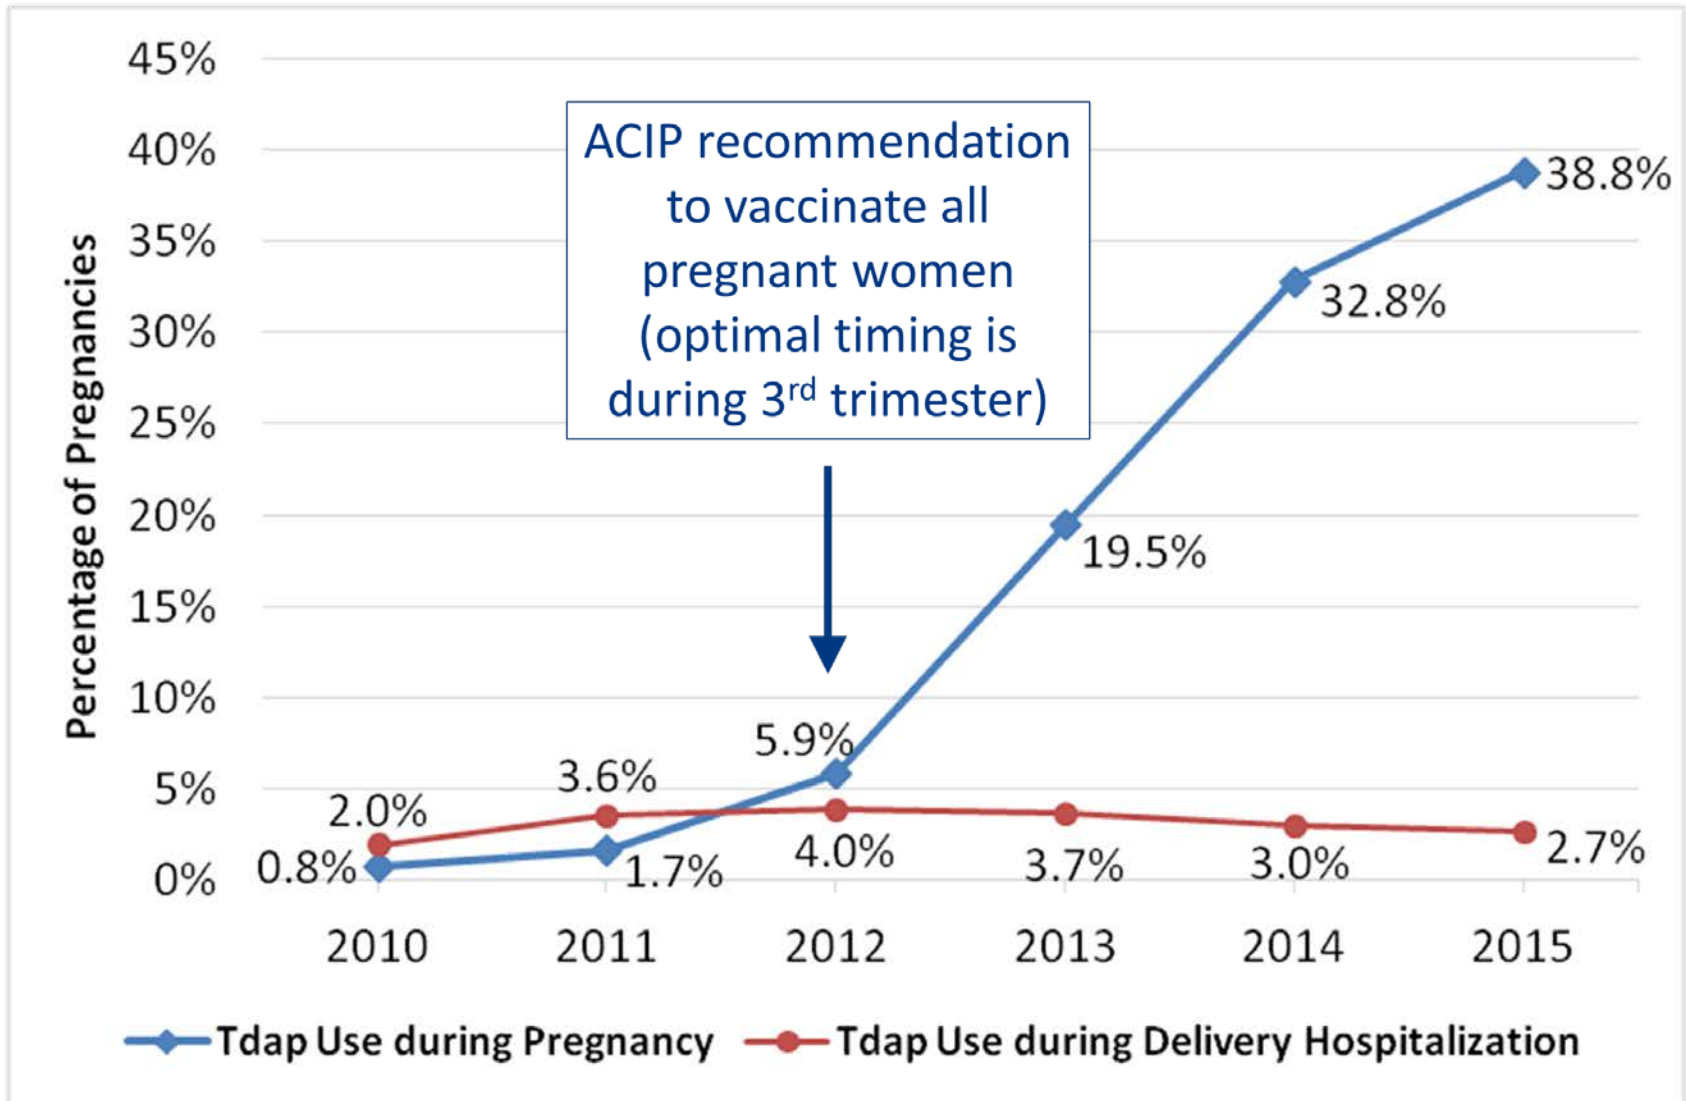

^b Not all Mini-Sentinel data partners contributed data for the entire study period

Trends of Tetanus, Diphtheria, and Acellular Pertussis (Tdap) Vaccination during Pregnancy in the Sentinel System

Genna Panucci, SM¹, Kinnera Chada², PhD, Hector Izurieta, MD, MPH², Azadeh Shoaibi, PhD, MS, MHS², Maria Said, MD, MHS², Richard Forshee, PhD², Joyce Obidi, PhD², Andrew Petrone, MPH¹, Noelle Cocoros, DSc, MPH¹, Tiffany Woodworth, MPH¹, Alison Kawai, ScD, SM¹
¹Department of Population Medicine, Harvard Medical School and Harvard Pilgrim Health Care Institute, Boston, MA, USA; ²Center for Biologics Evaluation and Research, U.S. Food and Drug Administration, Silver Spring, MD, USA

- In 2011, the Advisory Committee on Immunization Practices (ACIP) recommended that unvaccinated women receive Tetanus, Diphtheria, and Acellular Pertussis (Tdap) vaccination during pregnancy to protect infants from pertussis
- In 2012, the recommendation was expanded to include all pregnant women

Figure 2. Tdap Vaccinations during Pregnancy or Delivery by Year

Blood transfusion during pregnancy

- Need for rapid assessment of frequency of transfusion during pregnancy
- Identified 1,946,032 deliveries from 2008-2015 (~8% of U.S. deliveries)
- 21,048 (1.1%) pregnancies had blood transfusion
- Aggregate report across 15 data partners completed within 3 working days of final specification

Engaging Patients in Evidence Generation

Data Use

Learn more

Next

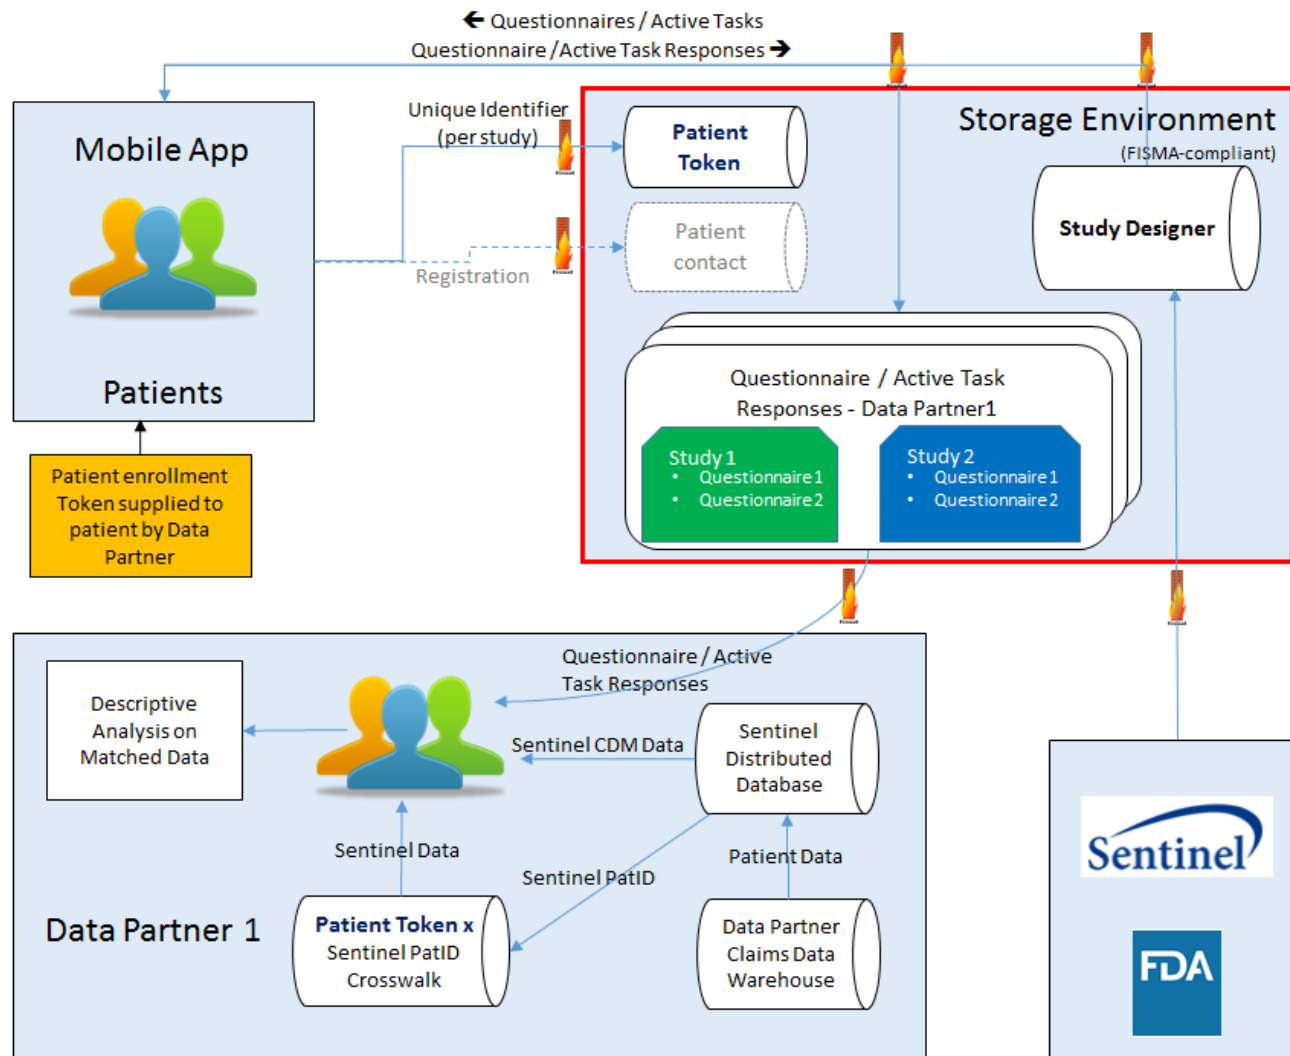

- Select a cohort and distribute enrollment tokens
- Participants download the app in iOS or Android app stores
- Informed consent via the app

Engage

- Data collected directly from patients (eg, due date, pregnancy start date)
- Participants respond when they choose within the study schedule
- Study Dashboard displays progress as well as highlights from data collection

Link Primary and Secondary Data

What's next?

- Incorporation of the mom-baby linked data for routine analyses
- NLP and other approaches to obtain critical data elements difficult to extract or not available in source data (veracity)
 - Pregnancy start
 - Family history
 - Treatment regimens
 - Disease progression
 - Radiologic findings
 - Demographics
 - Test results
- Methods to improve veracity
- Better tools to enable use of dispersed data (variety)
 - Horizontally and vertically partitioned distributed regression
 - Efficient patient finding and linkage
- Approaches for high velocity data (eg, inpatient, social media)
- **Application of research methods to Big Data**

Thank You
