

Discussion Question

What is a clinically meaningful *complete response rate* and *duration of response* in BCG-unresponsive CIS?

- From the 2013 workshop: Complete response (CR) rate of 40-50% at 6 months and a durable response of at least 30% for 18-24 months with the lower bound of the 95% confidence interval excluding 20% was thought to be clinically meaningful

FDA Guidance states that “If effective therapies become available in BCG-unresponsive NMIBC, a randomized trial may be appropriate”

- Are there effective medical therapies available that could serve as a control arm? What would those therapies be?
