## 1. INTRODUCTION

Estimates of potential intake of fibroin when used as a coating for food products were determined by estimating the intake of the associated food products and combining that with information on the application rate of fibroin to the food (mg fibroin applied/g food). Ramboll has performed calculations which estimate the consumption amounts of specific food products that could be covered by fibroin. Data reported by the Centers for Disease Control and Prevention (CDC) in the National Health and Nutrition Examination Surveys (NHANES) for 2013-2014 and 2015-2016 (CDC 2019a, 2019b) were used to make these calculations. With the consumption data and the estimates for the application rate of fibroin to foods, Ramboll calculated the potential intake of fibroin.

## 2. SOURCE OF DATA

NHANES is a multiyear program designed to assess the health and nutritional status of the civilian, non-institutionalized<sup>1</sup> adults and children in the United States. The NHANES program combines interviews on demographics, socioeconomic, dietary and health-related questions with an examination program that consists of medical, dental, and physiological measurements. In the NHANES dietary section, a trained dietary interviewer collects detailed information about the food and beverages consumed by the respondents on the previous day – from midnight to midnight. A second dietary recall interview is administered by phone 3 to 10 days after the first interview and is scheduled to occur on a different day of the week than the first interview. For NHANES 2013-2014, a total of 8,661 individuals provided complete dietary intakes for the first interview and 7,574 of these individuals provided a complete day 2 dietary intake recall. For NHANES 2015-2016, a total of 8,506 individuals gave complete dietary intakes for the first interview and 7,027 of these provided complete dietary intakes for the second interview. These two sets of dietary data (NHANES 2013-2014 and NHANES 2015-2016) were combined for this analysis along with the physiological data of body weight in kilograms (kg). Since multiple surveys were used, the population weights assigned to these data were adjusted so that the combination was still a nationally representative sample of dietary intake. When combining two sets of NHANES data (such as 2013-2014 and 2015-2016) the weights that provide national representation must be divided by 2, as specified by the CDC in their documentation of the NHANES data (CDC 2018).

To determine the grams of specific products in the food that was eaten by the NHANES survey participants, data from the United States Department of Agriculture's Food and Nutrient Data base for Dietary Studies (FNDDS) were used (USDA 2016, 2018). A new version of this database is released with each 2-year NHANES dietary data set. The FNDDS databases contain recipes which break down the food items identified in the NHANES data into ingredients by amount. The percentage of specific ingredients in the recipes can then be used to more accurately determine the amount of food consumed in a specific category being considered. For example, the recipes for fruit pies can supply the percentage of the pie that is actually fruit, and that percentage can be used to determine the grams of fruit consumption out of the total grams of fruit pie consumed.

### 3. CATEGORIZATION OF THE NHANES FOOD CODES

The categorization of the potential foods was completed within a combined list of the NHANES 2013-14 and 2015-16 food codes provided in Table H3. The selected foods of interest are detailed in Table H1, indicating categories and subcategories of food. All NHANES food codes not assigned to a food category of interest were excluded.

The 9,514 food items from NHANES are all categorized into one of the categories. In the case that the food item contains only ingredients that are part of the food category, this was taken into account by coding (see Table H3). If only part of the food item belongs to a category, the category is split. This indicates that the FNDDS recipes were used to determine what percentage of the food item should be placed in the categories listed in split columns.

To determine the applicable ingredients, a complete list of the standard reference (SR) codes for the ingredients in food was generated, compiled into Microsoft Excel, and specific SR codes which belonged to the desired categories were selected from within the food's listed ingredients. These SR codes were compiled into Table H4 with their respective category and description. During the procedure of the SAS analysis of the survey data, two output files were generated; one output contained the records for foods that could not be matched to selected SR codes (none were generated for this analysis) and the other contained all the NHANES foods codes that needed to be split into ingredients and the percentages of the categorized ingredients as determined from the recipes (Table H5).

## 4. GENERATION OF THE CONSUMPTION DATA

### Assignment of Food Categories to Reported Foods in NHANES

To determine the grams of specific products in the food that was eaten by the NHANES survey participants, data from the United States Department of Agriculture’s Food and Nutrient Databases for Dietary Studies (FNDDS) were used (USDA 2016, 2018). A new version of this database is released with each 2-year NHANES dietary data set. The FNDDS databases contain recipes which break down the food items identified in the NHANES data into ingredients by weight. The percentage of specific ingredients in the recipes can then be used to more accurately determine the amount of food consumed in a specific category being considered.

Sometimes, foods may have multiple ingredients, and some ingredients will be coated with Mori Silk, whereas some ingredients will not. These foods are categorized in Table H3 as a “Split”. Using the recipes reported in the FNDDS databases, a list of all the standard reference codes for foods in FNDDS (“SR Codes”) associated with NHANES food codes was compiled. Specific SR Codes which belonged to the desired categories were selected from within the food’s listed ingredients. The list of these selected SR Codes is provided in Table H4. In addition, for each NHANES food code indicated as a Split, the percentage of the recipe for that food code that consists of the ingredients that belong to a specific category was calculated and is reported in Table H5.

### Model Calculations

If a listed food item consists of a single category (e.g., Code 63223020 for Raw Strawberry), then 100% of the mass of that consumed food is added to the relevant category in Table H1 (e.g., Category 5A, Fruits with Edible Peels).

To more accurately account for additional consumption of multi-ingredient foods, the FNDDS recipes were used and analyzed as well.

If a listed food item corresponds to an FNDDS recipe that contains ingredients belonging to *multiple* categories, (e.g., Code 53312000 for Strawberry Pie), the mass percentage of the relevant ingredients is added to the respective categories in Table H2a.

For example: the 2015/2016 FNDDS recipe lists eight ingredients for that particular strawberry pie (NHANES Code 53312000). This can be seen in Table H2a, below.

SR_Code	Description	Sequence Number	Mass (g)
20081	Wheat flour; white; all-purpose; enriched; bleached	1	125
4615	Shortening; vegetable; household; composite	2	64.063
14429	Beverages; water; tap; municipal	3	29.625
2047	Salt; table	4	3
9316	Strawberries; raw	5	432
9152	Lemon juice; raw	6	15.5
20027	Cornstarch	7	12

<b>Table H2a. Example of Splitting Food Items for Food Category Assignment Strawberry Pie (Code 53312000)</b>			
<b>SR_Code</b>	<b>Description</b>	<b>Sequence Number</b>	<b>Mass (g)</b>
19335	Sugars; granulated	8	100

Of the eight ingredients, only one of the ingredients (Strawberries) would be coated at the proposed amount of Mori Silk. To determine the mass of the would-be-coated ingredient, the mass of the strawberries (432 grams) is divided by the sum of the masses of all 8 ingredients in the table above (781.19 grams) to get the percentage of the pie that would-be-coated:

$$432.00 \text{ g} \div 781.19 \text{ g} \times 100 = 55.3\%$$

Therefore, it is estimated that if an individual consumed 100 grams of this particular strawberry pie, that individual consumed 55.3 grams of strawberries (i.e., 55.3% of 100 grams). That mass is added to the relevant category (in this instance, Category 5A, Fruits with Edible Peels).

This process is repeated for all NHANES food codes that are indicated as "Splits" in Table H3.

## 5. DETERMINATION OF CONSUMPTION BY FOOD CATEGORY

On an individual basis, the amount of each food category consumed by a participant in the NHANES survey was determined for each day of the survey. Totals within categories and overall were calculated on an individual basis as well. The amount of food consumed was then averaged over the two days of the survey (if two days of data existed for that individual), and finally divided by the individual's body weight to obtain a food consumption per category in g/kg of body weight/day.

Survey statistics procedures were used for the calculations of the statistics reported (mean and 90<sup>th</sup> percentile) for amounts of food consumed in each category. These procedures use the sampling design and weighting methodology supplied by the CDC in the calculations. The "weights" assigned to each individual participating in the survey reflect the amount of the overall United States population that a specific person participating in the survey represents. The application of these weights in estimating potential intake provides values that reflect the entire United States civilian non-institutionalized population.

Survey procedures in SAS version 9.4 were used to determine the estimated mean and 90<sup>th</sup> percentile of amounts of food consumed in the United States population. Further detailed calculations are considered work product and available upon request. A summary of information is shown in **Table H2b**.

Category	Grams per day		Grams / kg-bw / day	
	Mean	90 <sup>th</sup> percentile	Mean	90 <sup>th</sup> percentile
Fish	14.4	47.5	0.2	0.6
Fruits	50.8	166.0	0.9	2.8
Vegetables	84.7	218.7	1.2	3.2
Cheese	18.3	49.0	0.3	0.7
Select Processed Foods	6.5	21.5	0.1	0.3
<b>Total</b>	<b>174.6</b>	<b>385.4</b>	<b>2.8</b>	<b>6.2</b>

\*Sample size = 16,210 for grams per day, 16,085 for grams/kg-bw/day. Differences in counts are due to lack of body weight data for specific individuals who had dietary data. Data presented is for all participants ages 2 years and older.  
Abbreviations: NHANES = National Health and Nutrition Examination Survey; kg = kilogram(s), bw = body weight
