# Evidentiary Expectations for 510(k) Implant Devices

---

## Draft Guidance for Industry and Food and Drug Administration Staff

***DRAFT GUIDANCE***

**This draft guidance document is being distributed for comment purposes only.**

**Document issued on September 7, 2023.**

You should submit comments and suggestions regarding this draft document within 90 days of publication in the *Federal Register* of the notice announcing the availability of the draft guidance. Submit electronic comments to <https://www.regulations.gov>. Submit written comments to the Dockets Management Staff, Food and Drug Administration, 5630 Fishers Lane, Room 1061, (HFA-305), Rockville, MD 20852-1740. Identify all comments with the docket number listed in the notice of availability that publishes in the *Federal Register*.

For questions about this document regarding CDRH-regulated devices, contact the Office of Product Evaluation and Quality, Office of Regulatory Programs, Division of Regulatory Programs 1 (Submission Support) at 301-796-5640. For questions about this document regarding CBER-regulated devices, contact the Office of Communication, Outreach, and Development (OCOD) at 1-800-835-4709 or 240-402-8010, or by email at [ocod@fda.hhs.gov](mailto:ocod@fda.hhs.gov).

# Evidentiary Expectations for 510(k) Implant Devices

## Draft Guidance for Industry and Food and Drug Administration Staff

*This draft guidance, when finalized, will represent the current thinking of the Food and Drug Administration (FDA or Agency) on this topic. It does not establish any rights for any person and is not binding on FDA or the public. You can use an alternative approach if it satisfies the requirements of the applicable statutes and regulations. To discuss an alternative approach, contact the FDA staff or Office responsible for this guidance as listed on the title page.*

### I. Introduction

As part of FDA’s [Medical Device Safety Action Plan: Protecting Patients, Promoting Public Health](#) (herein referred to as the “Safety Action Plan”),<sup>1</sup> FDA committed to strengthen and modernize the premarket notification [510(k)] Program. To enhance the predictability, consistency, and transparency of the 510(k) Program, FDA is issuing this guidance to provide our current thinking on 510(k) submissions for implant devices. This guidance is intended to serve as a primary resource on general recommendations for all implant devices for which a 510(k) is required (510(k) Implants), while device-specific guidances may provide further specificity for a given device type. This document is intended to clarify our evidentiary expectations for 510(k) Implants. By “evidentiary expectations,” we mean that this document is intended to assist industry in design and execution of appropriate performance testing that may be necessary to support 510(k) submissions for implants. It also provides general recommendations for other content, including proposed labeling, to include in these submissions. In addition, some of the recommendations in the guidance, such as those related to identification and mitigation of certain risks associated with implants, may be relevant beyond the context of preparing a 510(k) submission and helpful to consider throughout the total product lifecycle. For purposes of this guidance, a “submitter” is the entity that submits the 510(k) to FDA for review.

For the current edition of the FDA-recognized consensus standards referenced in this document, see the [FDA Recognized Consensus Standards Database](#).<sup>2</sup> For more information regarding use of consensus standards in regulatory submissions, refer to the FDA guidance titled “[Appropriate](#)

<sup>1</sup> Available at <https://www.fda.gov/about-fda/cdrh-reports/medical-device-safety-action-plan-protecting-patients-promoting-public-health>.

<sup>2</sup> Available at <https://www.accessdata.fda.gov/scripts/cdrh/cfdocs/cfStandards/search.cfm>.

*Draft – Not for Implementation*

35 [Use of Voluntary Consensus Standards in Premarket Submissions for Medical Devices](#)<sup>3</sup> and  
36 [“Standards Development and the Use of Standards in Regulatory Submissions Reviewed in the](#)  
37 [Center for Biologics Evaluation and Research.”](#)<sup>4</sup>  
38

39 In general, FDA’s guidance documents do not establish legally enforceable responsibilities.  
40 Instead, guidances describe the Agency’s current thinking on a topic and should be viewed only  
41 as recommendations, unless specific regulatory or statutory requirements are cited. The use of  
42 the word *should* in Agency guidances means that something is suggested or recommended, but  
43 not required.  
44

## 45 **II. Background**

46 In April 2018, CDRH issued the [Safety Action Plan](#) to communicate CDRH’s vision for  
47 modernizing measures to improve the safety of medical devices while continuing to create more  
48 efficient pathways to bring critical devices to patients. The [Safety Action Plan](#) describes efforts  
49 underway to modernize the 510(k) Program.  
50

51 In November 2018, FDA announced transformative new steps to modernize FDA’s 510(k)  
52 Program to advance the review of the safety and effectiveness of medical devices.<sup>5</sup> In connection  
53 with this announcement, FDA also requested public feedback on these steps to continue to  
54 modernize the framework for 510(k) review while promoting innovation and patient safety, and  
55 posed other questions that could inform regulatory policy development.<sup>6</sup> One area identified by  
56 the public comments where additional clarity and transparency would be helpful related to  
57 recommendations specific to 510(k) submissions for implants.  
58

59 Under section 510(k) of the Federal Food, Drug, and Cosmetic (FD&C) Act, a premarket  
60 notification submission (often referred to as a 510(k)) must be submitted to FDA at least 90 days  
61 before introducing, or delivering for introduction, a device into interstate commerce for  
62 commercial distribution.<sup>7</sup> A 510(k) is required for devices intended for human use, for which a  
63 premarket approval application (PMA) is not required, unless the device is exempt from the  
64 510(k) requirements of the FD&C Act and does not exceed the relevant limitations of  
65 exemptions in the device classification regulations. Through review of the 510(k), FDA

## *Contains Nonbinding Recommendations*

### *Draft – Not for Implementation*

66 determines whether the “new device”<sup>8</sup> is substantially equivalent<sup>9</sup> (SE) to a predicate device.<sup>10</sup>  
67 For additional information on how FDA evaluates SE in the 510(k) premarket review process,  
68 please see the FDA guidance entitled “[The 510\(k\) Program: Evaluating Substantial Equivalence](#)  
69 [in Premarket Notifications \[510\(k\)\]](#),”<sup>11</sup> hereafter called the “510(k) Program Guidance.”  
70

71 For FDA to find a new device SE to a predicate device, FDA must first find that the new device  
72 and predicate device have the same intended use. FDA must then find that the new device and  
73 predicate device have the same technological characteristics, or if they do not, that the different  
74 technological characteristics<sup>12</sup> of the new device do not raise different questions of safety and  
75 effectiveness and that the new device is as safe and effective as a predicate device.  
76

77 To determine the safety and effectiveness of a device, FDA weighs if there is “any probable  
78 benefit to health from the use of the device against any probable risk of injury or illness from  
79 such use,”<sup>13</sup> among other relevant factors. Under the 510(k) paradigm, the benefit-risk profile of  
80 the new device is determined in the context of a comparison to the benefit-risk profile of a  
81 predicate device; the benefit-risk profile of a new device with different technological  
82 characteristics does not need to be identical to that of its predicate device in order to determine if  
83 the new device is as safe and effective as a predicate device. The FDA guidance “[Benefit-Risk](#)  
84 [Factors to Consider When Determining Substantial Equivalence in Premarket Notifications](#)  
85 [\(510\(k\)\) with Different Technological Characteristics](#)”<sup>14</sup> describes considerations for evaluating  
86 benefit-risk profile of a device in comparison to a predicate device for purposes of SE  
87 determinations.  
88

89 FDA expects that submitters will typically provide a variety of non-clinical and/or clinical data  
90 to support that an implant is “as safe and effective” as a predicate device, given the scientific and  
91 clinical considerations that implants often raise. In addition, if FDA has established special  
92 controls applicable to the device type, the information in the 510(k) submission would need to  
93 demonstrate that the proposed device meets the relevant special controls for the device to be

---

<sup>8</sup> For purposes of this guidance, a “new device” means a device within the meaning of section 201(h) of the FD&C Act that is not legally marketed. It can be either a completely new device or a modification of a legally marketed device that would require a new 510(k).

<sup>9</sup> The standard for a substantial equivalence determination for a 510(k) submission is set out in section 513(i) of the FD&C Act.

<sup>10</sup> A predicate device is a legally marketed device. For purposes of an SE determination, a predicate device is (1) a device that was legally marketed prior to May 28, 1976 (preamendments device) and for which a PMA is not required, or (2) a device that has been classified or reclassified into Class II or I, or (3) a device that has been found to be SE through the 510(k) process. See 21 CFR 807.92(a)(3) and section 513(f)(2) of the FD&C Act.

<sup>11</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/510k-program-evaluating-substantial-equivalence-premarket-notifications-510k>.

<sup>12</sup> For purposes of an SE determination, “different technological characteristics” means, with respect to a device being compared to a predicate device, that there is a significant change in the materials, design, energy source, or other features of the device from those of the predicate device.” See section 513(i)(1)(B) of the FD&C Act.

<sup>13</sup> See 21 CFR 860.7(b).

<sup>14</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/benefit-risk-factors-consider-when-determining-substantial-equivalence-premarket-notifications-510k>.

## *Contains Nonbinding Recommendations*

### *Draft – Not for Implementation*

94 classified into class II, which may require, among other things, submission of certain  
95 performance data for the device.<sup>15</sup>

96  
97 As with all devices reviewed through the 510(k) process, to reach a scientifically justified  
98 determination regarding SE for an implant, FDA conducts a robust and comprehensive  
99 evaluation of information included in a submission. If necessary to reach a determination  
100 regarding SE, FDA will request additional information.<sup>16</sup> FDA may rely on descriptive  
101 information, non-clinical data and/or clinical data, including postmarket data, to support SE  
102 determinations for implants.

103  
104 In order to enhance transparency, consistency, and predictability of the review process and to  
105 promote the development of safe and effective 510(k) Implants, this guidance discusses  
106 considerations that are generally relevant to all types of implants subject to 510(k) requirements.  
107 It is intended to serve as a primary resource, used in conjunction with other guidances, to provide  
108 clarity and facilitate discussions regarding expectations for performance data that may be  
109 necessary to establish SE for implants. However, the type and quantity of performance data  
110 needed to support an SE determination for a particular device will vary depending on the device  
111 and/or device type, and on the differences from the predicate device. As noted above, the  
112 guidance also includes recommendations, such as those related to implant labeling, that are  
113 important to consider for any 510(k) Implant.

114  
115 To help guide submitters, this guidance also refers to a wide variety of guidances and voluntary  
116 consensus standards that might apply to a particular submission. While this document discusses  
117 recommendations for implants generally, device-specific guidances may provide further  
118 specificity for a given device type.<sup>17</sup>

119

### **120 III. Scope**

121 This guidance applies to implants for which a 510(k) is required. Implants subject to premarket  
122 approval, including those that may be eligible for the De Novo classification process, and  
123 implants that are exempt from the 510(k) requirements of the FD&C Act are outside the scope of  
124 this document.<sup>18</sup> An implant is defined in 21 CFR 860.3(d) as “a device that is placed into a  
125 surgically or naturally formed cavity of the human body.” The regulation further specifies that  
126 “[a] device is regarded as an implant for the purpose of this part only if it is intended to remain  
127 implanted continuously for a period of 30 days or more, unless the Commissioner determines

---

<sup>15</sup> See section 513(a)(1)(B) of the FD&C Act.

<sup>16</sup> See 21 CFR 807.87(m). For more information on FDA’s policies regarding requests for additional information, please see the FDA guidance, “[Developing and Responding to Deficiencies in Accordance with the Least Burdensome Provisions](https://www.fda.gov/regulatory-information/search-fda-guidance-documents/developing-and-responding-to-deficiencies-in-accordance-with-the-least-burdensome-provisions),” available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/developing-and-responding-to-deficiencies-in-accordance-with-the-least-burdensome-provisions>.

<sup>17</sup> To search for guidance documents, please see the database at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents>. Device-specific guidance documents can also be identified by searching for the relevant product code at <https://www.accessdata.fda.gov/scripts/cdrh/cfdocs/cfPCD/classification.cfm>.

<sup>18</sup> The De Novo classification process provides a pathway for certain new types of devices to obtain marketing authorization as class I or class II devices, rather than remaining automatically designated as a class III device, which would require premarket approval under section 513(f)(1) of the FD&C Act.

## *Contains Nonbinding Recommendations*

### *Draft – Not for Implementation*

128 otherwise in order to protect human health.” Therefore, the term “implant” in this guidance refers  
129 to devices intended to be implanted continuously for 30 days or more. However, FDA believes  
130 that many of the review considerations and associated recommendations in this guidance are also  
131 applicable to devices that are intended to remain implanted continuously for fewer than 30 days.  
132 For example, while a single catheter may only be used for a few days, a patient may routinely  
133 replace catheters as part of living with a chronic condition, and so cumulative patient exposure to  
134 a catheter may be significantly longer than 30 days and potentially lifelong. Therefore, we  
135 recommend that submitters of 510(k)s for devices intended to be implanted continuously for  
136 fewer than 30 days also consider the recommendations in this guidance. We note, however, that  
137 the amount and type of non-clinical and/or clinical data needed to support an SE determination  
138 may vary depending on the intended duration of implantation.

139  
140 We recommend that submitters consider the general recommendations in this document and  
141 discuss specific questions with the appropriate review division associated with their device by  
142 submitting a pre-submission. Additional information on the pre-submission program is available  
143 in the FDA guidance, “[Requests for Feedback and Meetings for Medical Device Submissions:  
144 The Q-Submission Program](#).”<sup>19</sup>  
145

## 146 **IV. Recommendations for 510(k) Implants**

### 147 **A. General Considerations**

148 We recommend that submitters consider the following questions regarding the evidence and  
149 information that may be necessary to support an SE determination for a 510(k) Implant.

#### 150 **(1) What are the indications for use of the device?**

151 FDA recommends that submitters carefully consider the indications for use of the device, taking  
152 into account the specific intended patient population, disease state, and conditions of use, when  
153 designing and conducting performance testing. For example, some 510(k) Implants may be  
154 indicated for palliative use in patients with limited mobility in a hospice care setting. Testing  
155 appropriate for these implants may be different than testing appropriate for implants indicated to  
156 remain permanently within an ambulating patient (e.g., a hip implant designed to accommodate  
157 repetitive mechanical loading). Similarly, FDA recommends that submitters provide  
158 performance data that are representative of the way in which the device is indicated to be used,  
159 including the anatomical location(s) for which it is indicated. For example, although orthopedic  
160 devices and dental devices may both interface with bone, the biochemical and biomechanical  
161 environment differ between dental and orthopedic devices and therefore data generated for an  
162 orthopedic device may not apply to a dental device.

163  
164 510(k) Implants specifically indicated for use in pediatric populations may have unique  
165 considerations compared to implants indicated for use in adults. For purposes of this guidance,  
166 FDA considers pediatric patients to be individuals who are 21 years of age or younger (that is,

---

<sup>19</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/requests-feedback-and-meetings-medical-device-submissions-q-submission-program>.

*Contains Nonbinding Recommendations*

*Draft – Not for Implementation*

167 from birth through the 21st year of life, up to but not including the 22nd birthday).<sup>20</sup> Designing  
168 pediatric implants can be challenging: pediatric individuals are often smaller and more active  
169 than adults; body structures and functions may change throughout development; and pediatric  
170 individuals may be long-term device users, which raises additional concerns about device  
171 longevity and long-term exposure to implanted materials. FDA recommends that for 510(k)  
172 Implants indicated for use in pediatric patients, submitters follow the recommendations in FDA’s  
173 guidance “[Premarket Assessment of Pediatric Medical Devices](#)”<sup>21</sup> (hereafter called the  
174 “Pediatrics Guidance”). Additionally, submitters should consider whether it is appropriate to  
175 extrapolate adult data for pediatric use. For example, certain orthopedic devices should be  
176 evaluated differently for pediatric patients versus adults due to differences in skeletal maturity.  
177 See FDA’s guidance “[Leveraging Existing Clinical Data for Extrapolation to Pediatric Uses of  
178 Medical Devices](#)”<sup>22</sup> for more information. Clinical studies with pediatric patients must comply  
179 with applicable requirements to protect the rights, safety, and welfare of children<sup>23</sup> involved as  
180 study participants, including FDA regulations at 21 CFR Part 50, Subpart D. FDA’s [Pediatrics  
181 Guidance](#) discusses these issues in more detail.

182 **(2) What is the intended duration of implantation?**

183 FDA recommends that submitters consider the intended duration of implantation or of patient  
184 exposure to the device when designing and conducting performance testing. While many  
185 implants are intended for permanent implantation, others are intended to be implanted for a  
186 period of time and then removed; still other implants are implanted and intended to degrade or  
187 resorb over time. Testing appropriate for a device that is intended to degrade over 30 days may  
188 be different than for a device that is intended to degrade over a year, or one that is not intended  
189 to degrade at all but is still subject to wear over its lifetime. In keeping with the least burdensome  
190 provisions,<sup>24</sup> in certain cases, FDA may consider whether results from shorter duration testing  
191 can be extrapolated to provide information about long-term performance. There may be implants  
192 for which non-clinical testing is suitably predictive of longer-term clinical performance, or for  
193 which 1-year performance is suitably predictive of 5-year performance. For devices expected to

---

<sup>20</sup> See section 520(m)(6)(E) of the FD&C Act (21 U.S.C. § 360j(m)(6)(E)(i)), which defines pediatric patients for purposes of a Humanitarian Device Exemption as age 21 years or younger at the time of diagnosis or treatment and specifies categories of pediatric subpopulations; see also 21 CFR 814.3(s).

<sup>21</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/premarket-assessment-pediatric-medical-devices>.

<sup>22</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/leveraging-existing-clinical-data-extrapolation-pediatric-uses-medical-devices>. The principles discussed in this guidance may be helpful regarding data considerations to support an indication for use of an implant in a pediatric population. We note, however, that if a change in the indications for use to add a pediatric indication constitutes a change in the intended use of the 510(k) Implant, the submitter would need to identify an appropriate predicate device with this same intended use in order to obtain clearance to market the device for the pediatric indication through the 510(k) process.

<sup>23</sup> FDA’s human subject protection regulations define “children” as “persons who have not attained the legal age for consent to treatments or procedures involved in clinical investigations, under the applicable law of the jurisdiction in which the clinical investigation will be conducted.” See 21 CFR 50.3(o). Therefore, some “pediatric” patients, as that term is used in this guidance, may not meet the definition of “children.”

<sup>24</sup> Please see the FDA guidance, “[The Least Burdensome Provisions: Concept and Principles](#),” available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/least-burdensome-provisions-concept-and-principles>, for additional discussion of FDA’s policies and implementation of the least burdensome provisions in the FD&C Act.

## *Contains Nonbinding Recommendations*

### *Draft – Not for Implementation*

194 be replaced repeatedly, we recommend that submitters consider testing reflective of the  
195 aggregate patient exposure.

196  
197 FDA recommends that submitters consider whether testing should be provided to address safety  
198 and effectiveness questions associated with wear or degradation, whether intended or  
199 unintended. Depending on the device and/or device type and its differences from the predicate, a  
200 combination of bench performance testing (e.g., wear testing and characterization of wear debris)  
201 and biological evaluation (e.g., *in vivo* testing) may be needed to demonstrate SE. Information  
202 related to wear and degradation provided in a 510(k) should consider the expected lifespan of the  
203 implant and take into account the implant location, potential local and systemic biological  
204 responses to the implant, and potential degradation products. When designing and conducting  
205 performance testing, we recommend accounting for “worst-case” implantation conditions.

### **(3) What is the anticipated patient and physician experience with the implant?**

206  
207  
208 FDA recommends that submitters consider both the patient and the physician experience with the  
209 implant in performing risk analysis and identifying performance testing that may be needed to  
210 demonstrate SE. Submitters should consider whether risks such as the following are relevant to  
211 their devices and are adequately addressed in their 510(k) submission. For example, the  
212 submitter should consider if certain features of its device could increase the risks identified  
213 below relative to the predicate:

- 214 • Risks associated with everyday activities (e.g., the effect to the implant during airport  
215 security screening or exposure to magnetic fields);
- 216 • Risks associated with ongoing or future medical care (e.g., magnetic resonance or  
217 interaction with other implants);
- 218 • Risks associated with reoperation or revision associated with the implant;
- 219 • Risks that may vary between different patient populations based on patient  
220 demographics;
- 221 • Risks associated with duration of use (e.g., physical discomfort or other adverse  
222 events);
- 223 • Risks associated with user interaction with the implant, including considerations  
224 regarding user training and instructions for ongoing maintenance of the device and/or  
225 device updates (e.g., software or firmware updates);
- 226 • Risks associated with device design/ergonomics and human factors issues related to  
227 use by a physician; and
- 228 • Risks associated with the implantation procedure, including shorter or longer  
229 operating time, infection, tissue damage caused by implantation, associated operative  
230 imaging radiation exposure, etc.

231

## **B. Non-Clinical Recommendations**

232  
233 This section highlights non-clinical issues that are generally relevant across 510(k) Implants and  
234 provides recommendations for related performance testing and information to include in a 510(k)  
235 submission. We recommend that submitters consider the non-clinical issues outlined below. We

## *Contains Nonbinding Recommendations*

### *Draft – Not for Implementation*

236 believe this will lead to higher quality submissions and a more efficient review process. In  
237 addition, we believe that considering the risks identified below and related mitigation strategies  
238 during the design process is an important part of efforts to continuously improve the safety of  
239 510(k) Implants. For information on recommended content and format of complete test reports  
240 for non-clinical bench performance testing in premarket submissions, generally, refer to FDA’s  
241 guidance, “[Recommended Content and Format of Non-Clinical Bench Performance Testing  
242 Information in Premarket Submissions](#),”<sup>25</sup> hereafter called the “Non-Clinical Bench Testing  
243 Guidance.”  
244

245 As explained above, the type and quantity of performance data needed to support an SE  
246 determination for a particular device will vary depending on the device and/or device type, and  
247 on the differences from the predicate device. Accordingly, it may not be necessary to provide all  
248 the information or conduct all the performance testing described below for a particular 510(k)  
249 submission. In cases where the submitter believes the information or testing described in this  
250 guidance does not apply to their device, we recommend that the submitter provides a rationale  
251 explaining why they believe the recommended information or testing is not applicable in the  
252 510(k) submission.

#### **(1) Biocompatibility**

254 We recommend that a biocompatibility evaluation for an implant be performed in accordance  
255 with the FDA guidance, “[Use of International Standard ISO 10993-1, ‘Biological evaluation of  
256 medical devices - Part 1: Evaluation and testing within a risk management process](#),”<sup>26</sup> hereafter  
257 called the “Biocompatibility Guidance.” In general, FDA’s recommendations in the guidance  
258 align with the framework established in ISO 10993-1 for identification of the nature and duration  
259 of contact (e.g., cumulative effects with repeat use).<sup>27</sup> However, FDA’s recommendations  
260 include several modifications to the evaluations identified in that standard. Attachment A of the  
261 [Biocompatibility Guidance](#) identifies a framework for developing a biocompatibility evaluation  
262 of a medical device, including an implant. For implants within the scope of this guidance (see  
263 Section III), regardless of the nature of body contact, we recommend that the following  
264 endpoints be considered, at a minimum, as part of a biocompatibility evaluation:

- 265 • Cytotoxicity
- 266 • Sensitization
- 267 • Irritation or intracutaneous reactivity
- 268 • Acute systemic toxicity

---

<sup>25</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/recommended-content-and-format-non-clinical-bench-performance-testing-information-premarket>. Note that the Non-Clinical Bench Testing Guidance does not apply to test reports for biocompatibility evaluation, reprocessing or sterilization validation, human factors, software verification and validation, and computational modeling. Information on those assessments is detailed in different guidances. Test reports for clinical studies, animal studies, and studies evaluating the performance characteristics of in vitro diagnostic devices are also excluded from the scope of the Non-Clinical Bench Testing Guidance.

<sup>26</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/use-international-standard-iso-10993-1-biological-evaluation-medical-devices-part-1-evaluation-and>.

<sup>27</sup> See ISO 10993-1:2009, Clause 5.2 “Categorization by nature of body contact” and Clause 5.3 “Categorization by duration of contact.”

## *Contains Nonbinding Recommendations*

### *Draft – Not for Implementation*

- 269           • Material-mediated pyrogenicity

270

271 Additional endpoints are recommended based on the particular nature of body contact:

- 272           • Subacute/subchronic toxicity
- 273           • Genotoxicity
- 274           • Implantation
- 275           • Hemocompatibility
- 276           • Chronic toxicity
- 277           • Carcinogenicity
- 278           • Reproductive/developmental toxicity
- 279           • Degradation

280

281 Note that FDA’s [Biocompatibility Guidance](#) recommends that biocompatibility endpoints, such  
282 as neurotoxicity and immunotoxicity, should be considered for devices where local or end organ  
283 toxicity assessments relevant to the implant location or toxicity issues of concern would not be  
284 assessed in a traditional biocompatibility study.

## 285           **(2) Sterility and Shelf Life**

### 286                   **a. Sterility and Pyrogenicity**

287 FDA expects most implants to be sterilized prior to implantation for patient safety. We  
288 recommend that submitters consider FDA’s guidance “[Submission and Review of Sterility  
289 Information in Premarket Notification \(510\(k\)\) Submissions for Devices Labeled as Sterile](#),”<sup>28</sup>  
290 hereafter called the “Sterility Guidance,” when preparing their 510(k) submission.

291

292 As stated in the [Sterility Guidance](#), implants should also meet pyrogen limit specifications.  
293 Pyrogenicity testing is used to help protect patients from the risk of febrile reaction due to either  
294 gram-negative bacterial endotoxins or other sources of pyrogens (e.g., material-mediated  
295 pyrogens). Unless the complete removal of pyrogens can be established, devices should be  
296 labeled as “non-pyrogenic” or “meets pyrogen limit specifications” instead of “pyrogen free” to  
297 more accurately communicate the device’s pyrogenicity risk to patients.

298

299 Note that the [Sterility Guidance](#) excludes from its scope sterilization processes for certain  
300 medical devices, including devices that incorporate materials of animal origin (i.e., human or  
301 animal tissues). For devices containing animal-derived materials, submitters should consider  
302 additional safety issues associated with disease transmission from the biological source. Please  
303 see FDA’s guidance “[Medical Devices Containing Materials Derived from Animal Sources  
304 \(Except for In Vitro Diagnostic Devices\)](#)”<sup>29</sup> for additional information concerning the sourcing of  
305 animal tissues, viral inactivation, sterilization, and risk management for these devices.

---

<sup>28</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/submission-and-review-sterility-information-premarket-notification-510k-submissions-devices-labeled>.

<sup>29</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/medical-devices-containing-materials-derived-animal-sources-except-vitro-diagnostic-devices>.

## *Contains Nonbinding Recommendations*

### *Draft – Not for Implementation*

#### 306 **b. Shelf Life and Packaging**

307 Shelf life testing is typically conducted to support the proposed expiration date of a device  
308 through evaluation of the package integrity for maintaining device sterility and/or evaluation of  
309 any changes to implant device performance or functionality over time.

310  
311 With respect to evaluating package integrity for maintaining device sterility, submitters should  
312 provide in their 510(k) submissions a description of the packaging, including how it will  
313 maintain the device’s sterility, and a description of the package integrity test methods, but it  
314 generally is not necessary to include the package test data. We recommend that a package  
315 validation study include simulated distribution and associated package integrity testing, as well  
316 as an aging process (accelerated and/or real-time) and associated seal strength testing, to support  
317 package integrity and shelf life claims. We recommend submitters follow the methods described  
318 in the FDA-recognized series of consensus standards ANSI/AAMI/ISO 11607-1: *Packaging for*  
319 *terminally sterilized medical devices – Part 1: Requirements for materials, sterile barrier*  
320 *systems and packaging systems* and ANSI/AAMI/ISO 11607-2: *Packaging for terminally*  
321 *sterilized medical devices – Part 2: Validation requirements for forming, sealing and assembly*  
322 *processes*, or request FDA feedback on appropriate package validation study methods through  
323 the Q-Submission Program<sup>30</sup> for packaging that falls outside of the scope of these standards.

324  
325 With respect to evaluating the effects of aging on device performance or functionality, shelf life  
326 studies should evaluate the critical device properties and specifications to ensure the device will  
327 perform adequately and consistently during the entire proposed shelf life. To evaluate device  
328 functionality, we recommend that relevant bench tests are conducted. We further recommend  
329 that all tests that evaluate design components or characteristics that are potentially affected by  
330 aging are repeated using aged devices as the test article.

331  
332 We recommend that submitters provide in their 510(k) submissions a summary of the test  
333 methods used for their shelf life testing, the results, and the conclusions drawn from their results.  
334 If submitters use accelerated aging of devices to conduct shelf life testing, we recommend that  
335 submitters specify the way in which the device was aged and provide a rationale to explain how  
336 the results of shelf life testing based on accelerated aging are representative of results based on a  
337 device aged in real time. In general, the stability testing results should demonstrate that device  
338 performance is comparable at both standard and elevated temperatures, and should demonstrate a  
339 linear correlation of accelerated aging data and real-time aging data. We recommend that  
340 accelerated aging of implants for shelf life/stability testing be conducted in accordance with the  
341 currently FDA-recognized version of ASTM F1980: *Standard Guide for Accelerated Aging of*  
342 *Sterile Barrier Systems for Medical Devices* and that submitters specify the environmental  
343 parameters established to attain the proposed device expiration date.

344  
345 For devices or components containing polymeric materials or coatings, testing on real-time, aged  
346 samples should be conducted to confirm the results of an accelerated aging study. This

---

<sup>30</sup> For details on the Q-Submission Program, please refer to the FDA guidance “[Requests for Feedback and Meetings for Medical Device Submissions: The Q-Submission Program](https://www.fda.gov/regulatory-information/search-fda-guidance-documents/requests-feedback-and-meetings-medical-device-submissions-q-submission-program),” available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/requests-feedback-and-meetings-medical-device-submissions-q-submission-program>.

## *Contains Nonbinding Recommendations*

### *Draft – Not for Implementation*

347 confirmatory testing can generally be conducted in parallel with 510(k) review, with results  
348 documented to file in the design history file (i.e., complete test reports typically would not need  
349 to be submitted to FDA). FDA recommends that submitters contact the relevant review division  
350 for more information regarding suitable aging protocols based on the device and materials’  
351 composition, as some material properties of implants (e.g., animal-derived components) may not  
352 be appropriate for accelerated aging testing.

#### 353 **(3) Reprocessing and Cleaning**

354 While implants are generally single-use, sterile devices, there may be implants that are  
355 reprocessed prior to implantation. For example, certain orthopedic devices may be provided non-  
356 sterile, but sterilized in a healthcare facility just prior to implantation (e.g., intervertebral body  
357 fusion devices). To ensure that the device is sterile, as intended, prior to implantation, the  
358 instructions provided for device reprocessing should be validated for the device. For devices  
359 intended to be reprocessed in this way, submitters should follow the recommendations in FDA’s  
360 guidance “[Reprocessing Medical Devices in Health Care Settings: Validation Methods and](#)  
361 [Labeling](#).”<sup>31</sup>

#### 362 **(4) Software and Cybersecurity**

363 Implants raise specific concerns associated with the duration of use and risks related to implant  
364 removal. Patients may live with an implant for years, or even permanently; therefore, long-  
365 lasting implants promote patient safety by minimizing the need for removal due to outdated  
366 software or other related vulnerabilities or failures.

367 For implants containing software, or devices containing software that communicate with  
368 implants, FDA recommends that submitters provide information in their 510(k) submission  
369 consistent with the recommendations in FDA’s guidance, “[Content of Premarket Submissions for](#)  
370 [Device Software Functions](#).”<sup>32</sup>

371 We also recommend that submitters provide in their 510(k) submissions information regarding  
372 the device’s cybersecurity risks and related controls to assure device functionality and safety,  
373 consistent with FDA’s guidance entitled, “[Content of Premarket Submissions for Management of](#)  
374 [Cybersecurity in Medical Devices](#).”<sup>33</sup> Additionally, cybersecurity risk should continue to be  
375 addressed throughout the total product lifecycle of these devices using the recommendations in  
376 the FDA guidance entitled, “[Postmarket Management of Cybersecurity in Medical Devices](#).”<sup>34</sup>  
377  
378

---

<sup>31</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/reprocessing-medical-devices-health-care-settings-validation-methods-and-labeling>.

<sup>32</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/content-premarket-submissions-device-software-functions>.

<sup>33</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/content-premarket-submissions-management-cybersecurity-medical-devices>.

<sup>34</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/postmarket-management-cybersecurity-medical-devices>.

## *Contains Nonbinding Recommendations*

### *Draft – Not for Implementation*

379 Consideration of cybersecurity information is often necessary as part of a premarket submission  
380 and as part of an adequate software validation and risk analysis required by 21 CFR 820.30(g).<sup>35</sup>  
381

382 The 510(k) premarket review process for implants containing software or devices containing  
383 software that communicate with implants will consider cybersecurity-related risks, including  
384 those that might necessitate the need for implant removal, in the context of comparing the new  
385 device to a predicate device. Specific consideration of cybersecurity risks early in the design  
386 process can significantly reduce or mitigate these risks (e.g., design with sufficient excess  
387 memory to allow for significant architecture updates that may be needed to maintain or  
388 reestablish security, or consideration for management of implants when End of Service and/or  
389 End of Life are reached).

### 390 **(5) Electrical Safety and Electromagnetic Compatibility**

391 FDA recommends that submitters of 510(k)s for implants with electrical components consider  
392 risks related to those electrical components, including the risks of electrical shock and  
393 electromagnetic interference with other devices, and provide information to support that those  
394 risks have been adequately mitigated. As an initial approach, FDA recommends that the  
395 electrical safety and electromagnetic compatibility (EMC) of implants with electrical  
396 components demonstrate conformity with consensus standards for electrical safety.  
397

398 510(k) submissions for electrically-powered medical devices often reference FDA-recognized  
399 consensus national or international standards for EMC. For medical electrical equipment or  
400 medical electrical systems (as defined in the International Electrotechnical Commission (IEC)  
401 60601-1 *Medical Electrical Equipment – Part 1: General Requirements For Basic Safety and*  
402 *Essential Performance*), submissions primarily reference the IEC 60601-1-2 standard or the  
403 equivalent United States (US) version.<sup>36</sup> In addition, there are device-specific consensus  
404 standards, or “particular” standards, under the IEC 60601-1 family (e.g., IEC 60601-2-X, where

---

<sup>35</sup> On February 23, 2022, FDA proposed to amend the device Quality System Regulation, 21 CFR Part 820, to align more closely with international consensus standards for devices ([87 FR 10119](https://www.federalregister.gov/documents/2022/02/23/2022-03227/medical-devices-quality-system-regulation-amendments); available at <https://www.federalregister.gov/documents/2022/02/23/2022-03227/medical-devices-quality-system-regulation-amendments>). Specifically, FDA proposed to withdraw the majority of the current requirements in Part 820 and instead incorporate by reference the 2016 edition of the International Organization for Standardization (ISO) 13485, *Medical devices – Quality management systems for regulatory purposes*, in Part 820. As stated in that proposed rule, the requirements in ISO 13485 are, when taken in totality, substantially similar to the requirements of the current Part 820, providing a similar level of assurance in a firm’s quality management system and ability to consistently manufacture devices that are safe and effective and otherwise in compliance with the FD&C Act. FDA intends to finalize this proposed rule expeditiously. When the final rule takes effect, FDA will also update the references to provisions in 21 CFR Part 820 in this guidance to be consistent with that rule.

<sup>36</sup> IEC 60601-1-2 Edition 3: 2007: *Medical Electrical Equipment - Part 1-2: General Requirements for Safety - Collateral Standard: Electromagnetic Compatibility - Requirements and Tests*, IEC 60601-1-2 Edition 4.0:2014: *Medical Electrical Equipment, Part 1-2: General Requirements for Basic Safety and Essential Performance – Collateral Standard: Electromagnetic Disturbances – Requirements and Tests*, AAMI/ANSI/IEC 60601-1-2: 2007/(R)2012: *Medical Electrical Equipment - Part 1-2: General Requirements for Safety - Collateral Standard: Electromagnetic Compatibility - Requirements and Tests*, and AAMI/ANSI/IEC 60601-1-2: 2014: *Medical Electrical Equipment - Part 1-2: General Requirements for Safety - Collateral Standard: Electromagnetic Disturbances - Requirements and Tests*.

*Contains Nonbinding Recommendations*

*Draft – Not for Implementation*

405 X denotes a particular device standard). These particular standards may augment or supersede  
406 the specifications in the IEC 60601-1-2 standard.

407  
408 Note that the IEC 60601-1 series of medical electrical equipment standards excludes implants.  
409 However, some implants are used with external devices, where the external device transmits  
410 energy to the implant; IEC 60601-1 may therefore apply to the external device and should be  
411 considered, if applicable. There are also consensus standards for certain active implantable  
412 medical devices that include information on EMC. One example is ISO 14708 *Implants for*  
413 *surgery – Active implantable medical devices – Part 3: Implantable neurostimulators*.

414  
415 In cases where an implant may include radio frequency (RF) wireless technology, the  
416 recommendations in FDA’s guidance, “[Radio Frequency Wireless Technology in Medical](#)  
417 [Devices](#),”<sup>37</sup> should be considered.

418  
419 In some cases, additional electrical safety and EMC testing may be needed to demonstrate SE,  
420 depending on the device and/or device type and the differences from the predicate device.

421 **(6) Magnetic Resonance (MR) Compatibility**

422 All implants have risks associated with exposure to an MR environment. FDA recommends that  
423 submitters consider the risks associated with their device when exposed to an MR environment  
424 and provide information to support that those risks have been adequately mitigated. FDA has  
425 provided recommendations on testing and labeling for implants for safety and compatibility in  
426 the MR environment in the FDA guidance “[Testing and Labeling Medical Devices for Safety in](#)  
427 [the Magnetic Resonance \(MR\) Environment](#).”<sup>38</sup> FDA recognizes that implants are subject to  
428 various magnetic resonance-related hazards, including the following, and recommends that  
429 submitters consider how to mitigate these hazards and other relevant hazards, as applicable,  
430 when designing their devices:

- 431 • Magnetically induced displacement forces or torque, leading to unwanted movement  
432 of the medical device and tissue damage;
- 433 • Heating of the medical device itself and/or tissue adjacent to the medical device from  
434 RF and switching gradient fields (dB/dt) of the MR system;
- 435 • Vibrations or electric potential induction due to an MR system’s pulsed gradient  
436 magnetic fields;
- 437 • Unintended tissue stimulation caused by rectified voltages generated by implants  
438 subject to RF exposure;
- 439 • Medical device malfunctions, either temporary or permanent, caused by exposure to  
440 an MR environment; and
- 441 • Corruption of MR images, including image artifacts, caused by the presence of  
442 metallic implants.

---

<sup>37</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/radio-frequency-wireless-technology-medical-devices-guidance-industry-and-fda-staff>.

<sup>38</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/testing-and-labeling-medical-devices-safety-magnetic-resonance-mr-environment>.

*Contains Nonbinding Recommendations*

*Draft – Not for Implementation*

443 (7) **Other Non-Clinical Performance Testing**

444 Additional kinds of non-clinical performance testing are often needed to demonstrate SE of a  
445 510(k) Implant to a predicate device. For example, materials used in implants can cause adverse  
446 biological responses depending on the material, implant duration, and implant location, that may  
447 not be identified in standard biocompatibility evaluations. Beyond the non-clinical evaluations  
448 discussed above, FDA recommends that submitters consider whether additional performance  
449 testing should be conducted to evaluate safety and effectiveness issues raised by differences  
450 between the new device and the predicate to demonstrate SE and help ensure that the device will  
451 perform safely and effectively across its expected lifespan. We recommend that all testing be  
452 conducted on final, finished devices. The amount and types of additional testing that should be  
453 considered can vary widely with the device or device type (e.g., testing considerations may vary  
454 based on the intended use of the device, implant duration, materials used, various failure modes  
455 related to implant geometry, manufacturing procedures and tolerances, and other unique implant  
456 characteristics) and with the differences between the new device and the predicate. Depending on  
457 these factors, some or all of the following testing may be applicable and needed to demonstrate  
458 SE, and the issues below should be considered when evaluating the risks associated with a  
459 510(k) Implant:

- 460
- 461 • **Corrosion:** Corrosion is the deterioration of a metal due to electrochemical reactions  
462 with its environment. Multiple corrosion mechanisms (pitting, fretting, galvanic) can  
463 result in the release of metal ions or other byproducts. Most device alloys form a  
464 protective oxide layer that reduces corrosion, but the biochemical and mechanical  
465 stresses of the implant environment can damage the protective layer and increase  
466 corrosion. Given sufficient time, corrosion can weaken the structural integrity of a  
467 medical device to the point of device collapse and failure. To help understand how  
468 the host body responds to metal devices, FDA recommends a combination of non-  
469 clinical studies on corrosion, the release of metal ions, and device-specific fatigue  
470 testing as well as animal and clinical studies, in some cases, to assess biological  
471 responses. FDA uses this information to evaluate biocompatibility issues, such as risk  
472 of immunological response, tissue destruction or overgrowth, and other adverse  
473 reactions. For recommendations related to corrosion testing of implants or materials,  
474 please see the FDA guidance “[Technical Considerations for Non-Clinical Assessment  
475 of Medical Devices Containing Nitinol.](#)”<sup>39</sup>  
476
  - 477 • **Fatigue:** Devices that are subject to repetitive stresses may fail and break. Implants  
478 should demonstrate adequate fatigue life under conditions simulating *in vivo* use to  
479 mitigate the risk of device breakage and failure during the expected lifespan of the  
480 device. FDA recognizes a variety of voluntary consensus standards to support  
481 mechanical fatigue tests for certain device types.<sup>40</sup>

---

<sup>39</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/technical-considerations-non-clinical-assessment-medical-devices-containing-nitinol>. The submitter may consider whether the recommendations regarding performance testing in this guidance may be informative for implants containing other metals.

<sup>40</sup> See the [FDA-Recognized Consensus Standards Database](https://www.accessdata.fda.gov/scripts/cdrh/cfdocs/cfStandards/search.cfm) available at <https://www.accessdata.fda.gov/scripts/cdrh/cfdocs/cfStandards/search.cfm>.

516  
517  
518  
519

- **Degradation:** Devices that are intended to degrade or resorb over time, or for which the technological characteristics are such that the device inevitably degrades after implantation, may lead to the release of degradation products into the local or systemic biological environment, causing inflammation or other biological reactions. An evaluation of the degradation profile of the device should be conducted under anticipated conditions of use, including worst-case scenario conditions, to understand the degradation profile over time and any conditions that may accelerate or modulate device degradation.
- **Particulate Characterization:** For implants subject to wear or degradation under repetitive motion or other processes, the characterization of particulates can be an important consideration. Therefore, the body’s response to any associated degradation products, including those leached from wear debris, should be assessed. This may be accomplished via injecting degradation products from non-clinical testing or other representative particles into an appropriate animal model.<sup>41</sup> Alternatively, it may be possible to demonstrate that the particulates generated have similar size/number/shape of particles as other similar, legally marketed devices, and that the degradation products are not bioavailable. Finally, devices may introduce particulates outside of wear or degradation scenarios (e.g., particulates left over from manufacturing) that should be characterized. For example, infusion pump systems may introduce particulates in the solutions they infuse.
- **Coating Characterization:** The surfaces of implants may have a coating (e.g., in the case of orthopedic or dental devices, to improve joint fixation through a porous rough surface texture). Although coatings may represent a small portion of an implant by volume, coatings can have a significant impact on safety and effectiveness. For implants with coatings, FDA recommends that submitters provide in their 510(k), at a minimum, information on the intended function of the coating, as well as detailed information regarding the materials used in the coating or its generation, bond method and bond strength between a coating and its substrate, and salient material or biochemical properties of the coating, including thickness, pore size, and overall volume of porous coatings. Note that there may be other FDA guidances related to coatings that apply to your device. For example, for detailed information regarding coatings for orthopedic implants, see FDA’s “[Guidance Document for Testing Orthopedic Implants With Modified Metallic Surfaces Apposing Bone Or Bone Cement](#).”<sup>42</sup>

---

<sup>41</sup> FDA supports the principles of the “3Rs” to replace, reduce, and/or refine animal use in testing, when feasible. We encourage submitters to consult with FDA if they wish to use a non-animal testing method that they believe is suitable, adequate, validated, and feasible. We will consider if a proposed alternative method could be assessed for equivalency to an animal test method. FDA also encourages the use of the Q-Submission Program to obtain feedback on the design of an animal study if an animal study is warranted.

<sup>42</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/guidance-document-testing-orthopedic-implants-modified-metallic-surfaces-apposing-bone-or-bone>.

- **Imaging Compatibility and Radiotherapy Compatibility:** After implantation, implants may need to be visualized by various imaging techniques to identify their position or orientation, including X-ray based techniques such as fluoroscopy or computed tomography (CT). Over their lifetime, many patients will also undergo imaging exams for other medical reasons. We recommend that implants be evaluated to determine whether the presence of the device impacts the image quality (e.g., image artifacts). For devices where detection via imaging is necessary to support future device removal or to support the safety of future surgical procedures, FDA recommends that you conduct radiopacity testing or other suitable imaging compatibility testing to demonstrate the device can be located. Additionally, as with MR, discussed above, other imaging exams and radiation therapy may also interact with implants. Even if the probability of an adverse event is low, we recommend that submitters assess the risks associated with exposure of the implant to other imaging exams and radiotherapy devices, including electronic component failure. FDA recommends that submitters consider the risks associated with their device when exposed to other types of imaging exams and radiation therapy and provide information to support that those risks have been adequately mitigated, such as by the device’s technical design, inclusion of appropriate information in the labeling, or a combination of these mitigation strategies. We recommend that manufacturers provide evidence-based recommendations for patients and physicians in the implant labeling on what to do if a patient needs to undergo an imaging exam. Since it is not feasible to evaluate all imaging protocols that may be considered for patients after they receive an implant, FDA recommends that manufacturers specify in the implant labeling the methods and results of imaging safety testing that has been performed and other safety information relevant to an imaging exam that should be considered to help inform physicians.
  - **Engineering Analysis:** It may be appropriate to evaluate some 510(k) Implants based on a combination of material specifications, finite element analysis (FEA), and/or other computational modeling approaches. A combination of engineering analyses and non-clinical testing may, in some cases, be sufficient to support SE, especially in circumstances where such analyses and testing have been validated to represent clinically-relevant failure modes. For more information on submitting computational modeling studies to support a device marketing submission, see the FDA guidance “[Reporting of Computational Modeling Studies in Medical Device Submissions](https://www.fda.gov/regulatory-information/search-fda-guidance-documents/reporting-computational-modeling-studies-medical-device-submissions).”<sup>43</sup>
  - **Bench Model Testing:** While analyses of components and possible failure modes are important to a comprehensive understanding of device performance, in some cases, it may be necessary for submitters to provide the results of testing using model systems with representative materials, geometries, and/or other simulated use parameters to evaluate the implant and demonstrate SE. In such cases, FDA recommends that submitters provide a rationale for the test set up and a discussion of how testing with

## Contains Nonbinding Recommendations

### Draft – Not for Implementation

562 a bench model represents device performance under the anticipated conditions of use,  
563 considering worst-case scenarios, as appropriate.

564  
565 Given the variety of implant types and unique considerations that different implants may raise,  
566 this guidance cannot provide recommendations regarding all bench-based performance tests that  
567 may be relevant for a specific implant. When considering performance testing to support an SE  
568 determination, submitters should consider the total product lifecycle experience with the implant  
569 type, available information on performance testing conducted for relevant predicate devices,  
570 device-specific guidance, and voluntary consensus standards applicable to a given device type.

#### 571 (8) Animal Testing

572 In many cases, non-clinical bench performance testing alone may not be adequate to demonstrate  
573 SE. For example, engineering analyses and mechanical tests may provide objective  
574 measurements for comparing an implant’s technological characteristics to those of a predicate  
575 device, but may not fully capture complexities related to clinical use to allow for a full  
576 assessment of how differences in technological characteristics affect safety and effectiveness. In  
577 these cases, evaluating *in vivo* performance may be the least burdensome way to demonstrate  
578 that an implant is SE to the predicate. While FDA’s primary purpose in recommending an animal  
579 study is often to generate safety information, these studies are frequently used to provide insight  
580 into other performance measures that can impact effectiveness as well.

581  
582 Below are some representative examples of situations where FDA may recommend animal  
583 testing:

- 584 • For implants that degrade, wear, or otherwise introduce foreign material into the local  
585 environment that is not intended to be removed (e.g., an implant that may abrade or  
586 damage tissue it contacts or against which it articulates);
- 587 • For implants where *in vivo* device migration or behavior is not well characterized in a  
588 bench model;
- 589 • To evaluate safety concerns where histological analysis is needed and human tissue  
590 biopsy is not feasible (e.g., local inflammation around the implant, or  
591 thrombogenicity/embolic effects in downstream tissues);
- 592 • To evaluate an anatomically similar clinical procedure/technique, where healthcare  
593 practitioner (HCP) training (e.g., knowledge and refinement of surgical technique,  
594 expertise in specialized procedures) is important for the device to be used safely; and
- 595 • To assess functional outcomes, including outcomes for devices intended to mitigate  
596 symptoms of injury or disease, where an animal model can be suitably extrapolated to  
597 human clinical performance.

598  
599 When considering the appropriate number of animals to use and amount of data, FDA  
600 recommends considering the ethical principles of replacement, reduction, and refinement, as well  
601 as the least burdensome principles,<sup>44</sup> with the goal of using the minimum number of animals

---

<sup>44</sup> Please see the FDA guidance, “[The Least Burdensome Provisions: Concept and Principles](https://www.fda.gov/regulatory-information/search-fda-guidance-documents/least-burdensome-provisions-concept-),” available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/least-burdensome-provisions-concept->

## *Contains Nonbinding Recommendations*

### *Draft – Not for Implementation*

602 necessary to generate valid scientific evidence sufficient to demonstrate SE. We encourage  
603 submitters to take advantage of the Q-Submission Program<sup>45</sup> to ensure that their animal study  
604 protocol addresses relevant safety issues and contains elements that are appropriate for studies  
605 intended to support a regulatory submission (e.g., is consistent with applicable Good Laboratory  
606 Practice (GLP) regulations in 21 CFR Part 58).

607  
608 FDA supports the principles of the “3Rs”<sup>46</sup> to replace, reduce, and/or refine animal use in testing,  
609 when feasible. We encourage submitters to consult with FDA if they wish to use a non-animal  
610 testing method that they believe is suitable, adequate, validated, and feasible. We will consider if  
611 a proposed alternative method could be assessed for equivalency to an animal test method. FDA  
612 also encourages the use of the Q-Submission Program<sup>47</sup> to obtain feedback on the design of an  
613 animal study if an animal study is warranted.

### **(9) Implant Device Design Considerations**

614  
615 Medical devices are manufactured from a wide variety of materials, using a variety of  
616 manufacturing processes. For certain implants, information regarding raw materials and critical  
617 aspects of manufacturing and processing steps, and how these impact device design and  
618 specifications, may be important to understanding the safety and effectiveness of the final,  
619 finished device relative to a predicate device. Examples where this information may be  
620 particularly important include:

- 621 • Implants composed of nitinol, as nitinol may release different amounts of nickel  
622 under fatigue (for more information, please see the FDA guidance “[Technical  
623 Considerations for Non-Clinical Assessment of Medical Devices Containing  
624 Nitinol](#)”<sup>48</sup>);
- 625 • Implants that may have different wear characteristics *in vivo* (e.g., please see the  
626 recommendations in the FDA guidance “[Characterization of Ultrahigh Molecular  
627 Weight Polyethylene \(UHMWPE\) Used in Orthopedic Devices](#)”<sup>49</sup>);
- 628 • Implants composed of degradable polymers, hydrogels, or other materials that may  
629 undergo material changes (e.g., form changes, degradation, *in situ* polymerization) *in*  
630 *vivo*;
- 631 • Implants for which residuals and impurities from manufacturing processes may  
632 remain in the packaged final finished form (e.g., animal derived materials following  
633 viral inactivation);

---

[and-principles](#), for additional discussion of FDA’s policies and implementation of the least burdensome provisions in the FD&C Act.

- 640
- Implants manufactured using additive manufacturing processes, as they may have different mechanical properties compared to devices made using traditional manufacturing methods; and
  - Implants with biologically-derived materials, because information regarding animal husbandry and materials processing may be necessary to evaluate risks of disease transmission and the adequacy of viral inactivation.

641 We recommend that submitters consider providing certain information regarding materials, specifications, and design for such implants. Specifically, submitters should consider providing information regarding materials and their sourcing and critical processing information, such as reaction parameters and/or solvents used in processing or cleaning. This information may allow FDA to better understand the final, finished form of the implant and its similarities to and differences from the predicate device, for purposes of determining if the new device is SE to the predicate device. This information may also be particularly important when evaluating the effect of changes to the manufacturing process (e.g., for uses of novel manufacturing processes) or for changes to device design (e.g., incorporation of a new surface treatment for a metal implant) on the safety and effectiveness of a previously cleared device.<sup>50</sup>

646

647

648

649

650

651

### 652 C. Human Factors/Usability

653 Human factors information may be needed to demonstrate SE for certain 510(k) Implant devices. For example, as part of an SE determination, FDA may need to evaluate the impact of differences between the user interfaces of the new device and the predicate device on safety and effectiveness. In addition, differences between the new device and predicate device could affect how the device may be used (e.g., by additional users or in different use environments) in a way that raises safety and effectiveness issues.

654

655

656

657

658

659

660 As part of their design controls, manufacturers should conduct a use-related risk analysis that includes the risks specific to the device use and the measures implemented to reduce those risks.<sup>51</sup> ANSI/AAMI/ISO 14971, *Medical Devices – Application of risk management to medical devices*, defines risk as the combination of the probability of occurrence of harm and the severity of that harm. However, because probability is generally difficult to determine accurately for use errors, and in fact many use errors cannot be anticipated until device use is simulated or observed, the severity of the potential harm is more meaningful for determining the need to eliminate (design out) or reduce resulting harm. If the results of the use-related risk analysis indicate that use errors could cause serious harm to the patient or the device user, then we recommend that appropriate human factors/usability (HF/U) engineering processes are applied

661

662

663

664

665

666

667

668

669

---

<sup>50</sup> See 21 CFR 807.81(a)(3). For more information on evaluating changes to a previously cleared device, and whether such changes require the submission of a new 510(k), see the FDA guidance, “[Deciding When to Submit a 510\(k\) for a Change to an Existing Device](https://www.fda.gov/regulatory-information/search-fda-guidance-documents/deciding-when-submit-510k-change-existing-device),” available at: <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/deciding-when-submit-510k-change-existing-device>.

<sup>51</sup> Under 21 CFR 820.30(g), design validation must “ensure that devices conform to defined user needs and intended uses and shall include testing of production units under actual or simulated use conditions.” It must also “include software validation and risk analysis, where appropriate.”

## *Contains Nonbinding Recommendations*

### *Draft – Not for Implementation*

670 according to the FDA guidance “[Applying Human Factors and Usability Engineering to Medical](#)  
671 [Devices](#).”<sup>52</sup>

672  
673 FDA recommends that HF/U engineering processes are followed during 510(k) Implant  
674 development, focusing specifically on the user interface, where the user interface includes all  
675 points of interaction between the product and the user(s), including elements such as displays,  
676 controls, packaging, product labels, and directions for use. The goal is to ensure that the device  
677 user interface has been designed such that use errors that could cause harm, including by  
678 compromising medical care, are either eliminated or reduced to the furthest extent possible. This  
679 is particularly important to consider for devices with complex interfaces designed to be  
680 implanted by HCPs and implants that involve post-implantation management by the patient  
681 and/or HCP (e.g., programming, monitoring, maintenance). FDA recommends that you consider  
682 the workflow and interactions between different user groups and with the device throughout the  
683 overall lifecycle of the device (including maintenance and removal). In general, HF/U testing  
684 should capture all critical tasks, including those related to the relevant workflows and expected  
685 lifespan of your device. As an example, you should consider whether there are any surgical  
686 implantation completion time endpoints that, if not met, could potentially result in serious patient  
687 harm or death; if so, this endpoint should be included as a critical task to be tested in HF/U  
688 validation testing.

689  
690 510(k) Implants may have specialized implantation instructions. Instructions and any training the  
691 manufacturer offers for the implanting physician should take into account how the device user  
692 interface and implantation technique(s) differ from similar device user interfaces and current  
693 standard of care, respectively. In any summative evaluation, the training provided to the human  
694 factors validation test participants should approximate the training that actual users would  
695 receive.

696

#### **D. Clinical Performance Testing**

698 While clinical data is not generally necessary to demonstrate SE in most 510(k) submissions,  
699 there are scenarios where clinical data may be needed to support an SE determination. The most  
700 common scenarios of when clinical data may be necessary in a 510(k) are discussed in the [510\(k\)](#)  
701 [Program Guidance](#)<sup>53</sup> and the draft guidance, “[Recommendations for the Use of Clinical Data in](#)  
702 [Premarket Notification \[510\(k\)\] Submissions](#),”<sup>54</sup> which, when final, will represent FDA’s current  
703 thinking on that topic. FDA’s draft guidance on “[Recommendations for the Use of Clinical Data](#)  
704 [in Premarket Notification \[510\(k\)\] Submissions](#)” is intended to clarify and provide additional  
705 context for situations when clinical data may be necessary to support SE. It discusses when such  
706 data may be needed in the context of a benefit-risk assessment conducted as part of determining  
707 if a new device with different technological characteristics that do not raise different questions of

---

<sup>52</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/applying-human-factors-and-usability-engineering-medical-devices>.

<sup>53</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/510k-program-evaluating-substantial-equivalence-premarket-notifications-510k>.

<sup>54</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/recommendations-use-clinical-data-premarket-notification-510k-submissions>.

*Contains Nonbinding Recommendations*

*Draft – Not for Implementation*

708 safety and effectiveness is as safe and effective as a legally marketed device, as well as other  
709 decision points in the 510(k) decision-making process.  
710

711 **E. Patient Experience Information**

712 Where relevant to determinations of SE, FDA encourages the collection, analysis, and  
713 integration of patient experience data for implants. Patient experience data includes patient  
714 preference information (PPI) and patient-reported outcomes. Patients’ perspectives on living  
715 with implants are most useful when they are relevant to the regulatory decision and reliably  
716 measured. Patient-reported outcome instruments facilitate the systematic collection of how  
717 patients feel, function, and survive as valid scientific evidence to support the regulatory and  
718 healthcare decision-making process. These instruments can be used to capture endpoints in  
719 clinical studies.  
720

721 We recommend that submitters consider the FDA guidance entitled “[Patient-Reported Outcome](#)  
722 [Measures: Use in Medical Product Development to Support Labeling Claims](#)”<sup>55</sup> and the FDA  
723 guidance entitled “[Principles for Selecting, Developing, Modifying, and Adapting Patient-](#)  
724 [Reported Outcome Instruments for Use in Medical Device Evaluation](#).”<sup>56</sup>  
725

726 CDRH has been a leader in incorporating PPI into regulatory decision-making. PPI may be used  
727 to help understand the relative value or the tradeoffs patients are willing to make among different  
728 benefits and risks associated with their condition and its diagnosis or management. PPI may be  
729 considered with the totality of evidence to inform an SE determination when evaluating the  
730 overall benefit-risk profile of an implant and whether that implant is as safe and effective as a  
731 predicate device.<sup>57</sup> For example, in the context of a 510(k), PPI has been used as valid scientific  
732 evidence to support clearance of expanded indications for use. We recommend that submitters  
733 considering use of PPI in a 510(k) Implant submission consult the FDA guidance entitled  
734 “[Patient Preference Information – Voluntary Submission, Review in Premarket Approval](#)  
735 [Applications, Humanitarian Device Exemption Applications, and De Novo Requests, and](#)  
736 [Inclusion in Decision Summaries and Device Labeling](#).”<sup>58</sup> Though the aforementioned guidance  
737 is not intended to cover 510(k) submissions, the content and recommendations regarding features  
738 of well-designed and -conducted patient preference studies may be helpful for submitters who  
739 are planning to include PPI studies in 510(k) submissions as well.  
740

<sup>57</sup> See the FDA guidance, “[Benefit-Risk Factors to Consider When Determining Substantial Equivalence in Premarket Notifications \(510\(k\)\) with Different Technological Characteristics](#),” available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/benefit-risk-factors-consider-when-determining-substantial-equivalence-premarket-notifications-510k>.

<sup>58</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/patient-preference-information-voluntary-submission-review-premarket-approval-applications>.

741 **F. Labeling and Other Recommendations**

742 **(1) Instructions for Use**

743 A 510(k) submission must include proposed labeling in sufficient detail to satisfy the  
744 requirements of 21 CFR 807.87(e), which requires a 510(k) to contain proposed labels, labeling,  
745 and advertisements sufficient to describe the device, its intended use, and the directions for use.  
746 Given the nature of implants, they are generally prescription devices and are exempt from having  
747 adequate directions for lay use required under section 502(f)(1) of the FD&C Act (21 U.S.C. §  
748 352(f)(1)) as long as the conditions in 21 CFR 801.109 are met. For instance, any labeling  
749 distributed by or on behalf of the manufacturer, packer, or distributor of the device that provides  
750 information for use of the device must include adequate information for the use of the device,  
751 including indications, effects, routes, methods, frequency and duration of administration, and any  
752 relevant hazards, contraindications, side effects, and precautions, under which practitioners  
753 licensed by law to employ the device can use the device safely and for the purposes for which it  
754 is intended, including all purposes for which it is advertised or represented (21 CFR 801.109(d)).  
755

756 Recognizing that implants are generally intended to remain with a patient for a long time, FDA  
757 expects that the physician would typically provide information to the patient about the  
758 implantation procedure and the benefits and risks of the device after implantation. FDA  
759 considers it important for manufacturers to provide information for the practitioner and also for  
760 patients about the risks of the device – including, but not limited to, information that can mitigate  
761 risks to health associated with layperson use errors after device implantation. This information is  
762 important to ensuring that implants are used safely and effectively across their expected lifespan.  
763 It is also important for practitioners to know how to educate their patients about risks that might  
764 arise throughout the implant’s expected lifespan. As such, we recommend that manufacturers  
765 provide patient information in a format that the practitioner could easily convey directly to the  
766 patient (e.g., separate patient labeling), which will help to ensure the implant is used safely and  
767 effectively. In particular, permanent implants may have risks for which labeling is especially  
768 important for safety during everyday activities or other medical procedures, such as during a  
769 magnetic resonance imaging (MRI) procedure, radiation exposure, or security screening.  
770 Labeling submitted in a 510(k) for an implant should take into account these risks.  
771

772 To the extent not already required under 21 CFR Part 801 or by applicable special controls, FDA  
773 recommends that all implants be accompanied by labeling that includes information on device  
774 operation, implantation instructions, and implant removal, if the device is intended to be  
775 removed.

776 **(2) Implant Cards and Other Patient Information**

777 As noted above, to help ensure continued safety over the expected lifespan of the implant, FDA  
778 considers it important for manufacturers to provide patients with 510(k) Implants information  
779 regarding their device. Certain information may be appropriate for inclusion in the form of an  
780 implant ID card for the patient or caregiver, while other information may be more appropriate for  
781 other forms of labeling. The choice to use a particular implant is often made by a physician or  
782 other licensed HCP based on their clinical experience and expertise. However, patients may not

*Contains Nonbinding Recommendations*

*Draft – Not for Implementation*

783 always know which implants they have, how to best manage their implants, or if there are  
784 adverse events reported for that implant model. Implant information is also important for parents  
785 or other caregivers responsible for patient care outside of a healthcare facility. FDA recommends  
786 including the information listed below on an implant ID card or other labeling that can be  
787 provided to patients or their caregivers for a 510(k) Implant:

- 788 • Implant identifying information, including model name and manufacturer, and  
789 implant location;
- 790 • Salient details regarding device composition and patient contacting materials,  
791 including pertinent information related to any known allergic reactions;
- 792 • Information regarding how to report malfunctions or other adverse events to the  
793 manufacturer; and
- 794 • For MR conditional implants, all conditions for safe MR use as described in the FDA  
795 guidance “[Testing and Labeling Medical Devices for Safety in the Magnetic  
796 Resonance \(MR\) Environment](#),”<sup>59</sup> as well as the MR Conditional icon from the  
797 currently recognized version of ASTM F2503: *Standard Practice for Marking  
798 Medical Devices and Other Items for Safety in the Magnetic Resonance Environment*.  
799

800 FDA recommends that manufacturers provide such information in a format that can be easily  
801 conveyed to patients. We encourage submitters to discuss patient labeling for 510(k) Implants  
802 with the appropriate FDA review division.

---

<sup>59</sup> Available at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents/testing-and-labeling-medical-devices-safety-magnetic-resonance-mr-environment>.
