# Postoperative Nausea and Vomiting: Developing Drugs for Prevention Guidance for Industry

## *DRAFT GUIDANCE*

**This guidance document is being distributed for comment purposes only.**

Comments and suggestions regarding this draft document should be submitted within 60 days of publication in the *Federal Register* of the notice announcing the availability of the draft guidance. Submit electronic comments to <https://www.regulations.gov>. Submit written comments to the Dockets Management Staff (HFA-305), Food and Drug Administration, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852. All comments should be identified with the docket number listed in the notice of availability that publishes in the *Federal Register*.

For questions regarding this draft document, contact (CDER) Mary Chung at 301-796-0260.

**Postoperative Nausea and Vomiting:  
Developing Drugs for Prevention  
Guidance for Industry<sup>1</sup>**

This draft guidance, when finalized, will represent the current thinking of the Food and Drug Administration (FDA or Agency) on this topic. It does not establish any rights for any person and is not binding on FDA or the public. You can use an alternative approach if it satisfies the requirements of the applicable statutes and regulations. To discuss an alternative approach, contact the FDA staff responsible for this guidance as listed on the title page.

**I. INTRODUCTION**

The purpose of this guidance is to help sponsors in the clinical development of drugs<sup>2</sup> for the prevention of postoperative nausea and vomiting (PONV) in adults. Specifically, this guidance provides recommendations regarding the design of clinical trials for drugs for the prevention of PONV, including considerations for eligibility criteria, trial design features, efficacy evaluations, and safety assessments.<sup>3</sup>

This guidance does not address the development of drugs for the *treatment* of PONV. Additionally, this guidance does not address the development of drugs for the prevention of PONV in pediatric patients.

In general, FDA’s guidance documents do not establish legally enforceable responsibilities. Instead, guidances describe the Agency’s current thinking on a topic and should be viewed only as recommendations, unless specific regulatory or statutory requirements are cited. The use of the word *should* in Agency guidances means that something is suggested or recommended, but not required.

**II. BACKGROUND**

PONV is a common and distressing complication of surgery occurring within the 0- to 24-hour postoperative period in approximately 30 percent of the general surgical population and

<sup>1</sup> This guidance has been prepared by the Division of Gastroenterology in the Center for Drug Evaluation and Research at the Food and Drug Administration.

<sup>2</sup> For the purposes of this guidance, all references to *drugs* refer to drugs approved under section 505 of the Federal Food, Drug, and Cosmetic Act (FD&C Act) (21 U.S.C. 355).

<sup>3</sup> In addition to consulting guidances, sponsors should contact the Division to discuss specific issues that arise during the development of drugs for the prevention of PONV.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

38 increasing to as high as 80 percent in high-risk patients.<sup>4</sup> PONV can be associated with  
39 decreased appetite, compromised nutrition and hydration, and prolonged hospitalization.  
40 Additional complications of inadequately controlled PONV include esophageal tears, wound  
41 dehiscence, and decreased self-care and functional ability.<sup>5</sup>

42  
43 Several risk factors have been associated with the development of PONV in adults. These  
44 include patient-specific risk factors (e.g., female sex, a history of PONV and/or motion sickness,  
45 nonsmoking status, and younger age), intraoperative risk factors (e.g., type of surgery  
46 [cholecystectomy, laparoscopic, bariatric, and gynecological surgeries have been associated with  
47 increased risk] and anesthesia administered [volatile anesthetic agents, such as halothane,  
48 isoflurane, desflurane, and sevoflurane; and nitrous oxide have been associated with increased  
49 risk]), and postoperative risk factors (e.g., opioid administration).<sup>4,5,6</sup> Volatile anesthetic agents  
50 are the primary cause of early PONV within the 0- to 2-hour postoperative period, and the risk of  
51 PONV has been found to be dependent on the dose and duration of administration of these  
52 agents.<sup>7</sup> Current clinical guidelines recommend that adults with at least one of the identified risk  
53 factors receive combination pharmacological PONV prophylaxis, which includes drugs from  
54 more than one pharmacological class that act on different receptor sites.<sup>4,5</sup>

55

56

### **III. DEVELOPMENT PROGRAM**

57

58

59

#### **A. Trial Population<sup>8</sup>**

60

61

62

63

Sponsors developing drugs for the prevention of PONV should consider the following when selecting trial populations:

---

<sup>4</sup> Apfel, CC, E Läärä, M Koivuranta, C-A Greim, and N Roewer, 1999, A Simplified Risk Score for Predicting Postoperative Nausea and Vomiting: Conclusions From Cross-Validations Between Two Centers, *Anesthesiology*, 91(3):693–700.

<sup>5</sup> Gan, TJ, KG Belani, S Bergese, F Chung, P Diemunsch, AS Habib, Z Jin, AL Kovac, TA Meyer, RD Urman, CC Apfel, S Ayad, L Beagley, K Candiotti, M Englesakis, TL Hedrick, P Kranke, S Lee, D Lipman, HS Minkowitz, J Morton, and BK Philip, 2020, Fourth Consensus Guidelines for the Management of Postoperative Nausea and Vomiting, *Anesth Analg*, 131(2):411–448.

<sup>6</sup> Roberts, GW, TB Bekker, HH Carlsen, CH Moffatt, PJ Slattery, and AF McClure, 2005, Postoperative Nausea and Vomiting Are Strongly Influenced by Postoperative Opioid Use in a Dose-Related Manner, *Anesth Analg*, 101(5):1343–1348.

<sup>7</sup> Apfel, CC, P Kranke, MH Katz, C Goepfert, T Papenfuss, S Rauch, R Heineck, C-A Greim, and N Roewer, 2002, Volatile Anaesthetics May Be the Main Cause of Early but Not Delayed Postoperative Vomiting: A Randomized Controlled Trial of Factorial Design, *Br J Anaesth*, 88(5):659–668.

<sup>8</sup> For recommendations and considerations regarding enrolling and retaining a representative clinical trial population, see the guidance for industry *Enhancing the Diversity of Clinical Trial Populations — Eligibility Criteria, Enrollment Practices, and Trial Designs* (November 2020). We update guidances periodically. For the most recent version of a guidance, check the FDA guidance web page at <https://www.fda.gov/regulatory-information/search-fda-guidance-documents>.

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

64 • Participants should be scheduled to undergo an operative procedure in which general  
65 inhalational anesthesia will be provided.

66  
67 • Participants should have two or more established risk factors for the development of  
68 PONV to facilitate the identification of a treatment effect.

69

### **B. Trial Design**

70

71 Sponsors developing drugs for the prevention of PONV should consider the following:

72

73  
74 • Participants meeting the inclusion criteria recommended in section III.A typically receive  
75 combination pharmacological PONV prophylaxis, which is consistent with clinical  
76 consensus guidelines. The regimen should be protocol-specified and standardized. With  
77 the exception of the investigational product and active comparator or placebo, as  
78 applicable, the same regimen should be given to all participants.

79

80 • Trials should be randomized, double-blind, and controlled. Sponsors can consider an  
81 active-controlled superiority or noninferiority<sup>9</sup> trial if an investigational product is  
82 anticipated to provide greater or similar benefit, respectively, than the drug designated as  
83 the active control within a standard-of-care combination pharmacological PONV  
84 prophylaxis regimen. Sponsors can consider a placebo-controlled superiority trial, in  
85 which all participants receive the same background standard-of-care combination  
86 pharmacological PONV prophylaxis, if an investigational product is intended to provide  
87 greater benefit than the standard-of-care regimen alone.

88

89 • Permitted rescue medications and their administration schedule should be protocol-  
90 specified and standardized.

91

### **C. Efficacy Considerations**

92

93 Sponsors developing drugs for the prevention of PONV should consider the following:

94

#### *1. Efficacy Assessments*

95

96 • To establish efficacy for the prevention of PONV, sponsors should assess the following:

97

98 – A primary efficacy endpoint of complete response should be defined as no vomiting  
99 and no use of rescue antiemetic medication in the 24 hours immediately following the  
100 completion of the operative procedure.

101

102 – A secondary endpoint of the absence of nausea should be defined as no nausea and no  
103 use of rescue antiemetic medication in the 24 hours immediately following the  
104

105

---

<sup>9</sup> For recommendations and considerations regarding noninferiority clinical trials, see the guidance for industry *Non-Inferiority Clinical Trials to Establish Effectiveness* (November 2016).

## ***Contains Nonbinding Recommendations***

*Draft — Not for Implementation*

106 completion of the operative procedure.<sup>10</sup>

### 107 108 2. *Statistical Considerations*

- 109
- 110 • Sponsors should analyze the primary endpoint (i.e., a binary endpoint defined as no  
111 vomiting and no use of rescue antiemetic medication) and secondary endpoint (i.e., a  
112 binary endpoint defined as no reported nausea and no use of rescue antiemetic  
113 medication) by evaluating the difference in the proportions of responders across  
114 treatment arms.
  - 115
  - 116 • Sponsors should adjust statistical analyses for baseline participant characteristics and  
117 other related factors that may impact efficacy outcomes (e.g., age, female sex, history of  
118 PONV and/or motion sickness, nonsmoking status, opioid administration) in order to gain  
119 precision when evaluating overall treatment effects. Sponsors should also consider  
120 exploring subgroup analyses and potential treatment interactions based on these factors.
  - 121
  - 122 • Sponsors should prespecify the approach to ensure control of the type I error rate when  
123 testing multiple endpoints (i.e., primary and secondary endpoints) for which labeling  
124 claims may be of interest. If an endpoint will be tested for both noninferiority and  
125 superiority, each test should be prespecified in the multiple testing procedure and  
126 appropriate methods should be used to control the type I error rate across both tests.
  - 127

### 128 **D. Safety Considerations**

129  
130 Sponsors developing drugs for the prevention of PONV should consider the following:

- 131
- 132 • As trials of drugs for the prevention of PONV include administration of combination  
133 pharmacological PONV prophylaxis, assessments of potential interactions between the  
134 investigational product and coadministered drugs, including allowable rescue  
135 medications, should be conducted early in development.
  - 136
  - 137 • Some antiemetic drugs have the potential to cause QT prolongation. The timing and  
138 frequency of electrocardiogram assessments should be based on the arrhythmogenic  
139 potential of the investigational product, as well as the arrhythmogenic potential of  
140 coadministered drugs, including allowable rescue medications. Sponsors should consider  
141 the potential for combined effects on the QT interval due to drug co-administration.
  - 142
  - 143 • Drug-specific considerations may alter the minimum acceptable size of the safety  
144 database, including whether the drug in question is a new molecular entity or has relevant  
145 supportive safety data from other populations, the known and anticipated adverse events  
146 of the drug and drug class, and nonclinical findings.
  - 147

---

<sup>10</sup> Demonstrating significant treatment effect on the primary endpoint of complete response (no vomiting and no use of rescue antiemetic medication) in the absence of a significant treatment effect on the secondary endpoint (no nausea and no use of rescue antiemetic medication) may not be sufficient to support an indication for the prevention of the nausea component of the indication.
