I. Introduction

A. Purpose of this Document

This document is intended for:

- Commercial processors who manufacture, process, or pack thermally processed low-acid foods packaged in hermetically sealed containers (historically referred to as “low-acid canned foods” or “LACF”)¹; and
- Persons who are authorized to act on behalf of such commercial processors².

Commercial processors who manufacture, process, or pack LACF are subject to the registration requirements of 21 CFR 108.35(c)(1), as well as the process filing requirements of 21 CFR 108.35(c)(2). These provisions require two basic types of submissions:

- Food Canning Establishment Registration using Form FDA 2541; and
- Process filings using the following forms:
 - Form FDA 2541d (Food Process Filing for Low-Acid Retorted Method)
 - Form FDA 2541f (Food Process Filing for Water Activity /Formulation Control Method)
 - Form FDA 2541g (Food Process Filing for Low-Acid Aseptic Systems)

This document provides detailed instructions on how to submit process filings by using an *electronic* Form FDA 2541g (Food Process Filing for Low-Acid Aseptic Systems). Form FDA 2541g is intended for low-acid foods (as defined in 21 CFR 113.3(n)) where the growth of microorganisms is controlled through the application of heat to foods and where the processing involves use of aseptic processing and packaging (as defined in 21 CFR 113.3(a)).

This document does not provide:

- Instructions for *paper* submission of Form FDA 2541g (Food Process Filing for Low-Acid Aseptic Systems);
- Instructions for submitting process filing Form FDA 2541f in either electronic or paper format;

¹ Although some hermetically sealed containers (e.g., pouches and glass bottles) used to package thermally processed low-acid foods generally would not be viewed as “cans,” the term “low-acid canned foods” has been used for decades as a shorthand description for “thermally processed low-acid foods packaged in hermetically sealed containers,” and we continue to use that term (and its abbreviation, LACF) for the purposes of this document.

² Individuals who are authorized to act on behalf of commercial processors may do so for more than one commercial processor. Reference 1 addresses our electronic system for submitting process filing and identifies the responsibilities of each type of authorized user for that system.

- Instructions for submitting Form FDA 2541d (Low-Acid Retorted Method) in either electronic or paper format;
- Instructions for submitting Form FDA 2541e (Acidified Foods) in either electronic or paper format;
- Instructions for submitting plant registration Form FDA 2541 in either electronic or paper format; or
- Instructions on how to use the *electronic* system for acidified foods (AF) and LACF (which we call the AF LACF Online System).

B. Abbreviations

Abbreviation	Full Term
AF	Acidified Food
AR	Authorized Representative
ECP	Establishment Contact Person
FCE	Food Canning Establishment
FFR	Food Facility Registration
FIS	FDA Industry System
FURLS	FDA Unified Registration and Listing Systems
LACF	Low-Acid Canned Foods
ROAR	Read Only Authorized Representative
SID	Submission Identifier
SUPER AR	Super Authorized Representative

C. Additional Resources

For additional information about registration and process filing for commercial processors of LACF, see our guidance entitled “Guidance for Industry: Submitting Form FDA 2541 (Food Canning Establishment Registration) and Forms FDA 2541d, FDA 2541e, FDA 2541f, and FDA 2541g (Food Process Filing Forms) to FDA in Electronic or Paper Format” (Ref. 1 and the appendices in Reference 1.)

See instructions entitled “How to Use AF/LACF Electronic System” (Ref. 2 and the appendices in Reference 2) which cover:

- Portals for Electronic Submissions;
- How to Obtain an FDA Industry Systems (FIS) Account through the FIS Electronic Portal;
- How to Enter the Electronic AF/LACF System Through the FIS Electronic Portal;
- General Information About Navigating the Process Filing Section of an Establishment’s Electronic AF/LACF System;
- How the Establishment Contact Person for an Establishment Manages Access to the Establishment’s Electronic AF/LACF System;
- General Information About the Organization of the Process Filing Folders;
- How to Manage Process Filings; and
- How to Search Process Filings.

II. How to Submit Electronic Process Filing Form FDA 2541g

A. General Information

The electronic Form FDA 2541g contains 9 Steps (Sections A through I).

- All mandatory fields on the electronic Form FDA 2541g must be completed. Only three sections include optional information:
 - In Step 1 (Section A), Question 1 (Food Product Group) is optional.
 - In Step 4 (Section D), Question 3 (Net Weight (Optional)) is optional.
 - Section I, Additional Information (Optional) is optional.
- When you manufacture, process, or pack a product in more than one container size or type, you are required to submit a separate Form FDA 2541g for each container size and type.
- You may report multiple forms of the product (e.g., Liquid (i.e., all liquid no solids); liquid with solids (diced, chunks, pieces, etc.); paste/puree) on the same Form FDA 2541g, provided that:
 - Other factors (e.g., container type or size) do not require separate filing; and
 - The process information you provide in Step 8 (Section H) of Form FDA 2541g applies to each product variation. If the heat transfer rates are different for each product variation, the process for the slowest heating formulation with the fastest flow (laminar

- correction factor) must be filed. The comment section of the filing form should state on which formulation product the process is based.
- You may report multiple product packing mediums on the same Form FDA 2541g provided that:
 - Factors other than “product packing medium” (e.g., container type or size) do not require separate filing; and
 - The process information you provide in Step 8 (Section H) of Form FDA 2541g applies to each product variation. If the heat transfer rates are different for each product variation the process for the slowest heating formulation with the fastest flow (laminar correction factor) must be filed. The comment section of the filing form should state on which formulation product the process is based.
 - You may report multiple products with minor formulation changes (e.g., drinks formulated with different flavors) on the same Form FDA 2541g provided that:
 - Other factors (e.g., container type or size) do not require separate filing; and
 - The process information you provide in Step 8 (Section H) of Form FDA 2541g applies to each formulation of the product. If the heat transfer rates are different for each product formulation variation, the process for the slowest heating formulation with the fastest flow (laminar correction factor) must be filed. The comment section of the filing form should state on which formulation product the process is based.
 - Brand names of products generally should not be part of the Product Name. However, you may need to include the brand name as part of the Product Name if it is necessary to distinguish products that are produced using different scheduled processes. You need not submit a separate Form FDA 2541g for each brand name of a product that is manufactured, processed, or packed under more than one brand name if the scheduled process for each brand is exactly the same.
 - An aseptic processing system includes a product sterilization system and a packaging sterilization system and may include a surge tank system. In Step 5 (Section E) of Form FDA 2541g, you provide [some](#) information about the product sterilization system. You provide the remaining information about the product sterilization system, and information about a surge tank system if you use one, in a “Supplemental Submission” (see Appendix C). With respect to information about the packaging sterilization system, you likewise provide some information on Form FDA 2541g (in this case, in Step 7 (Section G), and the remaining information about the packaging sterilization system in the “Supplemental Submission.”

B. What You Need to Know About Saving Preliminary Drafts of Form FDA 2541g

In general, you can save information you enter into Form FDA 2541g after each step in the data entry process, exit the system, and return later to continue data entry into subsequent sections of the form. Importantly, the electronic system distinguishes required information from optional information. After you begin data entry for a section of the form, the “Save and Exit” function is not available until you complete data entry for all the required information in that section. Therefore, we recommend that you only begin

data entry in a new section of the form if you expect to complete data entry in that section.

Likewise, when you will be submitting separate forms for related products (such as for a product that you manufacture, process, or pack in multiple container sizes), and much of the information about each of these products will be the same, the electronic system enables you to copy a previously submitted form to your Draft folder and then edit that form (e.g., to change the container size) for subsequent submission to FDA. (See Ref. 2 for instructions on how to copy a form.) As you edit a previously submitted form, you may save the edited information in your draft folder and continue editing the form later. However, you should be aware that deleting some required information from the form, without replacing that required information with new information before you try to save the form, may cause the system to prompt you to add that required information before you can save the form.

C. What You Need to Know About Adding Attachments to Form FDA 2541g

1. Types of Documents That You Can Attach

Some sections of Form FDA 2541g require that you provide documentation by attaching an electronic file to the form (see Figure 1). In addition, a “Review” screen allows you to add optional documentation (see Figure 2) that you consider would help FDA review the form. Examples of such documentation include pictures, schematics, or other supporting information. The electronic AF/LACF system supports attachments of the following document types: (1) PDF; (2) JPG; (3) GIF; (4) XLS; (5) XLSX; (6) DOC; (7) DOCX; (8) RTF; and (9) TXT. Within an FCE’s AF/LACF Online System, the file name for an attachment must be unique.

2. The Two Procedures That You Can Use to Attach a Document

There are two procedures that you can use to attach a document:

- Use the “Browse” function to attach a document from your personal computer or network. When you use the “Browse” function, you will be adding a new document to the “Document Library” already in the FCE’s AF/LACF Online System. The file name for this new document cannot be the same as the file name for any document already in that Document Library.
- Use the “Document Library” function to attach a document previously submitted to the FCE’s AF/LACF Online System. When you use the “Document Library” function, you will attach a document that already has a unique file name for the purpose of the FCE’s AF/LACF Online System, and you will not need to rename the file. In other words, attaching a document from within the FCE’s “Document Library” allows you to attach the same document to several SIDs without giving that document a different file name each time you attach it to a new SID.

Figure 1 is an example of a computer screen that provides buttons to select either the “Browse” or “Document Library” functions when the AF/LACF Online System prompts

you to attach a required document during data entry. Later in this document (see section II.C.3), we describe how to add a required attachment during data entry.

Figure 1 - AF/LACF Online System Prompts You to Attach a Required Document During Data Entry

SECTION C CONTAINER TYPE

Note: The maximum allowed file size is 50 MB. The accepted file types include the following: jpg, doc, docx, txt, xls, xlsx, pdf, gif and rtf.

Note: If the product is not packaged in one of the container types identified below, select Other.

>> Clear

Select one:

1. Aluminium/Tinplate/Steel Can

2. Flexible Pouch

a) What is the shape of the container? Irregular

Attach a picture or schematic: Browse... Upload

Document Library

3. Semi-Rigid

4. Other

<< Back >> Save & Exit >> Continue

<< Cancel & Start Again

After you have entered required information into all sections of the form, the AF/LACF Online System will display a “Review” screen. The review screen displays the entire process filing form before submission and provides you an opportunity to attach optional documents that will help FDA review your form. See section II.O of this document for more information about the Review screen. Figure 2 shows an example of the “Additional Info” section that you will see on the “Review” screen. The “Additional Info” screen provides buttons to select either the “Browse” or “Document Library” functions. Later in this document (see section II.C.4), we describe how to add an attachment at the “Review” screen.

Figure 2 – Additional Information - Attach Document from the Review Screen

The screenshot shows a web interface titled 'SECTION I ADDITIONAL INFORMATION'. At the top, there is a note: 'If you consider any additional information pertinent to the product and/or the scheduled process critical factor(s), enter that information in the comment box and/or attach one or more documents containing the additional information. File size is limited to 50MB. Acceptable file types are: .jpg, .doc, .docx, .txt, .xls, .xlsx, .pdf, .gif, .rtf.' Below this, the 'Attachment Type' is set to 'Other'. There is an 'Attach document:' field with a 'Browse...' button and an '>> Upload' button. A 'Document Library' button is also present. A note states: 'Note: You may enter up to 4000 characters in the comment field. If your comment exceeds 4000 characters, you can upload a file with your comment.' Below this is a 'Comments:' text area with a character count: '(Maximum characters: 4000) You have 4000 characters left.' A form below contains pre-filled data: 'Full Name : Tester Test', 'Establishment Name : Test Company', 'State or Province : Maryland', 'Country(other than U.S.) : UNITED STATES', 'Date : 07/23/2014', and 'Telephone No : 3011212121'. At the bottom, there is a note: 'Note: If there are any attachments in addition to those that are required, they need to be added prior to submitting the filing.' and three buttons: '<< Cancel & Start Again', '>> Save & Exit', and '>> Submit'.

3. How to Add Required Attachments During Data Entry

a) How to Attach a Document Using the “Browse” Function

Follow the steps below using the “Browse” function to add a document from your personal computer or network.

- Select “Browse” to display file folders from your personal computer system or network (See Figure 3)
- Select the folder containing the document to be attached and then select the document from within that folder.
- Click Open. The system will enter the folder path and file name on the screen (see Figure 4).
- Select “Upload.” The system will display the uploaded file’s name and size (see Figure 5). The system also will provide an opportunity to either (1) select a link to view the content of the file or (2) remove the file as an attachment.

Figure 3 – System Display After You Select the “Browse” Function

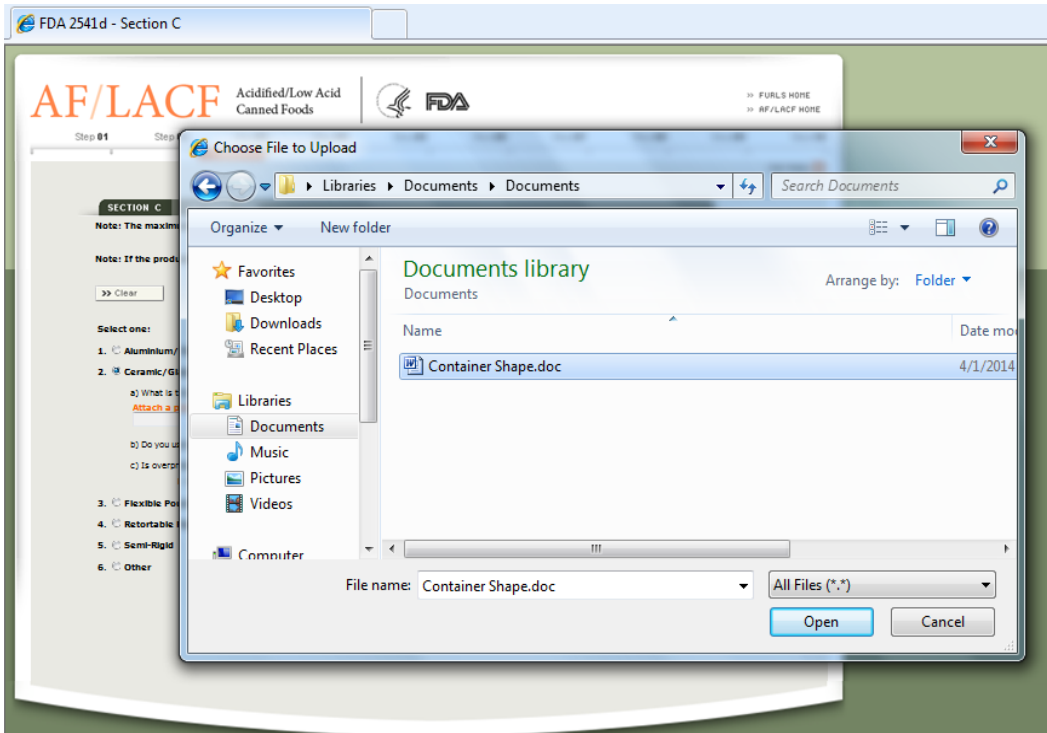

Figure 4 – System Display After You Select the Folder and File Using the “Browse” Function

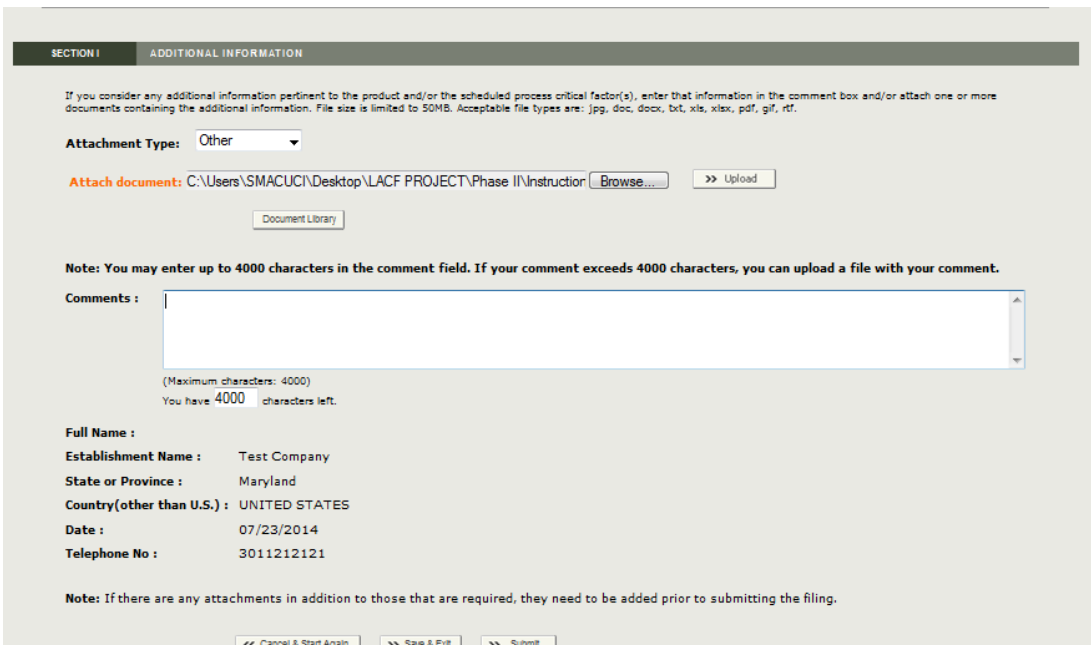

Figure 5 – System Display After You Upload a Document Using the “Browse” Function

SECTION I ADDITIONAL INFORMATION

If you consider any additional information pertinent to the product and/or the scheduled process critical factor(s), enter that information in the comment box and/or attach one or more documents containing the additional information. File size is limited to 50MB. Acceptable file types are: jpg, doc, docx, txt, xls, xlsx, pdf, gif, rtf.

Attach document:

	Attachment Type	File Name	File Size (MB)	
1	Other	compartment type container_20140723145515659.jpg	0.0041	Remove
Total Size:			0.0041	

Note: You may enter up to 4000 characters in the comment field. If your comment exceeds 4000 characters, you can upload a file with your comment.

Comments :

Date : 07/23/2014
Telephone No : 3011212121

Note: If there are any attachments in addition to those that are required, they need to be added prior to submitting the filing.

b) How to Attach a Document Using the “Document Library” Function

Follow the steps below to attach a document from the Document Library in the FCE’s AF/LACF Online System.

- Select “Document Library” to display the document library for the FCE’s filed SIDs (see Figure 6).
- Select the check box next to the document name to be attached.
- Select “Upload Selected Document Library.” The system will display the uploaded file’s name and size (see Figure 7). The system also will provide an opportunity to either (1) select the link on the file name to view the content of the file or (2) remove the file as an attachment.

Note: If there are any attachments in addition to those that are required, they need to be added prior to submitting the filing.

4. How to Add Optional Attachments from the Review Screen

You may add optional attachments during the final review of the process filing form under the “Additional Info” section of the “Review” screen.

Follow the steps below to attach a document from the “Additional Info.” section of “Review” screen using either the “Browse” or “Document Library” function.

- Select the down arrow next to “Type of Attachment” to display a List of Values. Figure 8 shows an example of the computer screen displaying Memo/Letter, Study, Lab Report, Container Schematic, Retort Schematic, and Other Supporting Documentation within the List of Values.
- Select the “Browse” function and follow the steps in section II.C.3.a or “Document Library” function and follow the steps in section II.C.3.b.
- Repeat the above steps until all attachments are added.

Figure 8 - Attach Document –List of Values for the Type of Attachment

SECTION I ADDITIONAL INFORMATION

If you consider any additional information pertinent to the product and/or the scheduled process critical factor(s), enter that information in the comment box and/or attach one or more documents containing the additional information. File size is limited to 50MB. Acceptable file types are: jpg, doc, docx, txt, xls,xlsx, pdf, gif, rtf.

Date : 07/23/2014
Telephone No : 3011212121

Note: If there are any attachments in addition to those that are required, they need to be added prior to submitting the filing.

[Cancel & Start Again] [Save & Exit] [Submit]

D. How to Access the Process Filing Folders for a Specific Establishment

To access the Process Filing folders for a specific establishment, enter the FIS electronic portal using your FIS Account and then select the AF/LACF Main Menu. See Ref. 2 for instructions on how to enter the FIS electronic portal. From the AF/LACF Main Menu, select Access AF/LACF Process Filing.

The system will display a list of Food Canning Establishment (FCE) numbers you are authorized to access (Figure 9). If you are only authorized to access one FCE number,

the system will display the FCE Process Filing Folder Main Menu for that FCE (Figure 10).

Figure 9 shows a picture of an example of a computer screen showing the FCE List Main Menu that you would see if you are the Establishment Contact Person (ECP) for an establishment. The “Manage User Role and Access” function on this screen only displays when the user is authorized as the ECP.

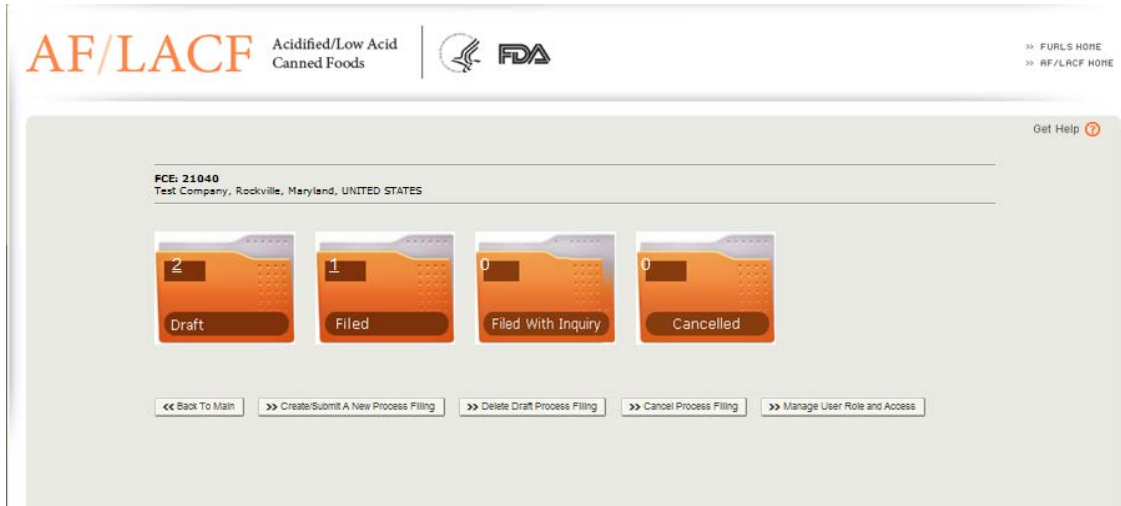

Figure 9 – Example of the FCE List Main Menu

Select the applicable FCE number to reach the FCE Process Filing Folder Main Menu for that establishment. The specific display of the AF/LACF Process Filing Folder Main Menu depends on the information already in the FCE’s AF/LACF Online System. For example, if there are no process filings in the Draft Folder (e.g., because all process filings prepared by the user have already been submitted) the AF/LACF Process Filing Folder Main Menu will display the Draft Folder with a zero (0) count to indicate that there are no process filing forms in the folder.

Figure 10 shows a picture of an example of the FCE Process Filing Folder Main Menu that you would see if you are the Establishment Contact Person (ECP) for an establishment. The system display would be the same for all other authorized users, except that users other than the ECP will not see the “Manage User Role and Access” function.

Figure 10 - FCE Process Filing Folder Main Menu

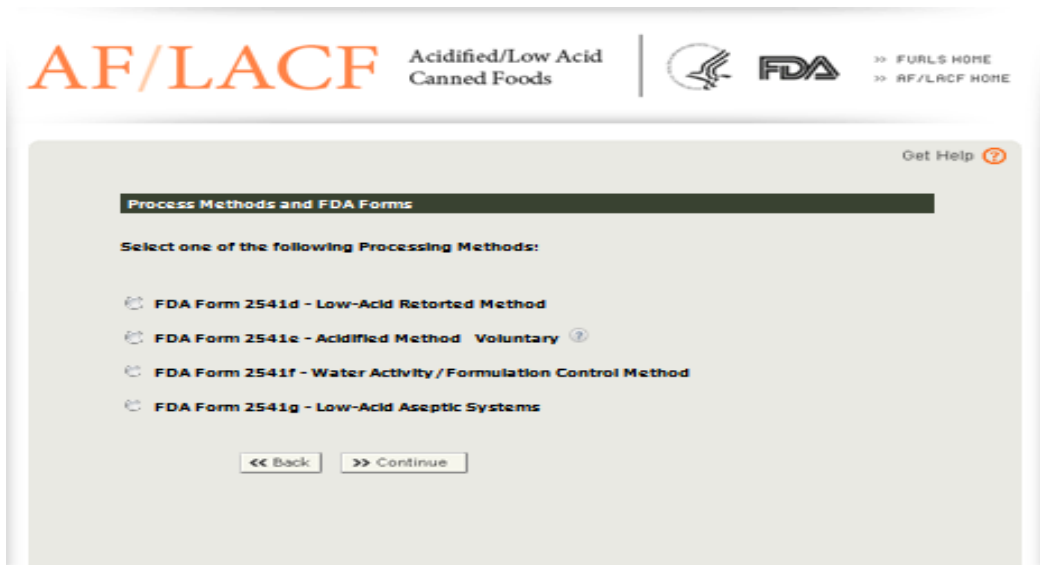

Select Create/Submit a New Process Filing. The system will display the Process Methods and Forms screen. See section II.E of this document for instructions on selecting the process method and form.

E. Process Methods and FDA Forms

Figure 11 shows a picture of the computer screen displaying the available process methods and forms. Select Form 2541g – Low-Acid Aseptic Systems and then select the “Continue” button to start the submission process.

Figure 11 - Process Methods and FDA Forms Screen

F. Top of Form – Food Canning Establishment Number and Submission Identifier

The system automatically enters the FCE number and a Submission Identifier (SID) at the top of Form FDA 2541g, before Section A, based on your selection of the FCE and process method/ FDA form (Figure 12). The “Date Received by FDA” will reflect the date you submit the form to FDA electronically and will appear on the completed submission. See Section II.F.2 of these instructions for detailed information about what a SID is and how it is assigned.

DEPARTMENT OF HEALTH AND HUMAN SERVICES
Food and Drug Administration

Food Process Filing for Low-Acid Aseptic Systems (Form FDA 2541g)

Note: There are separate process filing forms for each of the following: Food Process Filing for Low-Acid Retorted Method (Form FDA 2541d); Food Process Filing for Acidified Method (Form FDA 2541e); Food Process Filing for Water Activity/Formulation Control Method (Form FDA 2541f); and Food Process Filing for Low-Acid Aseptic Systems (Form FDA 2541g).

USE FDA INSTRUCTIONS ENTITLED "[Instructions for Electronic Submission of Form FDA 2541g \(Food Process Filing for Low-Acid Food Aseptic Systems\)](#)"

Food Canning Establishment (FCE) Number:

Submission Identifier (SID) (YYYYMMDD###)

<< Back >> Continue

1. Food Canning Establishment (FCE) Number:

The system automatically enters the FCE number.

2. Submission Identifier (SID):

The SID is a unique number associated with each new process filing. The system will assign the SID. The combination of the FCE number and the SID identifies a specific process filing form.

The SID is a combination of:

- (1) The date (i.e., year, month, and day of the month) that a process filing form is created; and

- (2) A sequence number that would distinguish multiple forms created on the same date. The sequence number starts with 001 and continues (002, 003) for as long as necessary to uniquely identify all forms created on the same date.

If you create multiple types of process filing forms on the same date (e.g., if you create three Forms FDA 2541g and three Forms FDA 2541f on the same date), the sequence number would increase by 001 for each created form rather than begin again at 001 for each type of form (see examples immediately below).

When you create multiple *electronic* forms, the system will assign the SID and automatically enter the SID on the form using the following format:

YYYY-MM-DD/SSS

Where:

YYYY represents the calendar year (e.g., 2013, 2014)

MM represents the month (e.g., 02 for February, 10 for October)

DD represents the day of the month (e.g., 02, 19, 30)

SSS represents the assigned sequence number (e.g., 001, 002, 003).

Examples of SIDs include:

2013-02-22/001: The first Form FDA 2541g created on February 22, 2013

2013-02-22/002: The second Form FDA 2541g created on February 22, 2013

2013-02-22/003: The third Form FDA 2541g created on February 22, 2013

2013-02-22/004: The fourth process filing form, this one a Form FDA 2541f, created on February 22, 2013

2013-02-22/005: The fifth process filing form, this one a Form FDA 2541f, created on February 22, 2013

2013-02-22/006: The sixth process filing form, this one a Form FDA 2541f, created on February 22, 2013

G. Step 1 – Section A. Product Information

From the display screen for the Top of Form FDA 2541g as shown in Figure 12 above, select the “Continue” button. The system will display Step 1 (Section A).

Figure 13 shows a picture of the computer screen when a user is at Step 1 (Section A) in the procedure for creating a new process filing.

Figure 13 - Step 1 (Section A) Product Information

The screenshot shows the AF/LACF (Acidified/Low Acid Canned Foods) web interface. At the top, there is a navigation bar with steps 01 through 08, with Step 01 highlighted. The AF/LACF logo and the FDA logo are also present. The main content area is titled "SECTION A PRODUCT INFORMATION" and includes a note: "Note: Section A.1 (Food Product Group) requests optional information." Below the note is a "Clear" button. The form contains four numbered sections: 1. (Optional) Select one Food Product Group. The dropdown menu is set to "Baby Food (infant/junior foods including infant formula)". 2. Enter Product Name. The text input field contains "Peas and Carrots". 3. What is the form of the product? This section has four radio button options: "Liquid (i.e., all liquid no solids)", "Liquid with Solids (e.g., diced, chunks, pieces, etc.)", "Paste/Puree" (which is selected), and "Other". 4. What is the packing medium? This section has five radio button options: "Brine", "Cream/Sauce/Gravy" (which is selected), "Oil", "Syrup", and "Water". At the bottom of the form are five buttons: "<< Back", ">> Save & Exit", ">> Continue", "<< Cancel & Start Again", and a "Get Help" link with a question mark icon.

Step 1 (Section A) of the electronic process filing system has required fields for the name of the product, the form of the product (e.g., whole, cut), and product packing medium (e.g., brine, all liquid). Step 1 (Section A) also includes optional information for the food product group (e.g., vegetables, baby food).

1. Food Product Group (Optional):

We request information about “Food Product Groups” to help us understand the nature of your products. The information you provide helps FDA prioritize which commercial processing facilities to inspect. The Food Product Group is optional information (i.e., you are not required to identify the Food Product Group.) If you choose to fill in this information and there is no single best Food Product Group applicable to the product, select “Other.”

2. Enter Product Name.

Describe the actual food commodity or formulated food in the container (e.g., carrot juice, pumpkin puree, chicken broth, cheese sauce).

- If the product is named in a foreign language, provide its English equivalent first and then provide the foreign language name in parentheses (e.g., cheese sauce (sauce au fromage)).

The product name may include scientific names. When a scientific name is in Latin, the product name should also include the common English translation or description of the scientific name (e.g., potato soup (Solanum Tuberosum pulmentum)).

- Brand names should not be part of the product name unless a brand name is necessary to distinguish products that are produced using different scheduled processes.

Some product names may include qualifying terms that identify unique species, processing methods, or organoleptic or visual properties. Some products may be compartmentalized, and include multiple types of foods. For such products, specify these unique properties. If, however, you are submitting the same Form FDA 2541g for multiple products with minor formulation differences indicate those minor formulation differences with the product name. (See section II.A of these instructions.) For example, if you are submitting the same Form FDA 2541g for a beverage that you make in both strawberry and banana flavor, indicate those flavors as part of the product name. Some examples of product names:

- Enter “Coconut Water (banana or strawberry)” (when submitting one form for both formulas), not “Coconut Water” and not “Water”
- Enter “Energy drink (chocolate flavors),” not “Energy drink”
- Enter “Cheese Sauce (with Jalapeño pieces),” not “Cheese Sauce”
- Enter “Milk (1%, 2%, or whole),” (when submitting one form for multiple milk products), not “Milk”

3. What is the form of the product?

The product form relates to the shape or appearance of the product itself (e.g., whether the liquid also contains solids, and whether the product is a paste or puree) rather than the characteristics of the container.

Select one or more product forms listed on the filing form. If the product form is all liquid with no solids, select “Liquid (i.e., all liquid no solids). You may report multiple forms of the product on the same Form FDA 2541g with the caveats discussed in section II.A of this document. If none of the product forms listed on the form apply, select “Other” and enter the product form in the space provided.

4. What is the packing medium?

In general, “packing medium” refers to the liquid portion(s) of a product when the liquid is added over, or added to, the solid portion(s) of a product. You may report multiple product packing mediums on the same Form FDA 2541g with the caveats discussed in section II.A of this document.

Select one or more packing mediums listed on the form. If a product is all liquid, select “None.” If none of the choices are applicable, select “Other” and enter the packing medium in the space provided.

After you complete this section, select “Continue.”

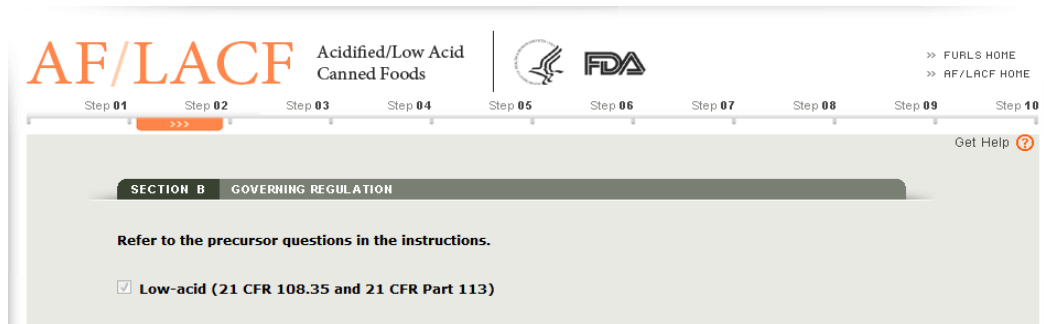

H. Step 2 – Section B. Governing Regulation

Form FDA 2541g only applies to low-acid aseptic systems, which are regulated pursuant to 21 CFR 108.35 and 21 CFR Part 113. Form FDA 2541g does not apply to an acidified food that has a finished equilibrium pH of 4.60 or below, even if the acidified food is packaged using an aseptic system. Use Form FDA 2541e for an acidified food packaged using an aseptic system.

Because Form FDA 2541g only applies to low-acid foods, the electronic system automatically enters this “Governing Regulation” in Section B of the form and, therefore, you do not have to enter this information yourself. Because the electronic system automatically enters the correct governing regulation in the form, the system will skip Step 2 (Section B) and display Step 3 (Section C). For your convenience, Figure 14 shows a picture of the computer screen showing Step 2 (Section B) with the governing regulation automatically entered.

At this stage in the data entry process, you can select “Save and Exit.” Doing so saves all the information you entered so far in the Draft Folder. Alternatively, you can select “Continue” to enter information for Step 3.

Figure 14 - Step 2 (Section B) Governing Regulation

The screenshot shows the AF/LACF (Acidified/Low Acid Canned Foods) electronic form interface. At the top, the logo "AF/LACF" is displayed in orange, followed by the text "Acidified/Low Acid Canned Foods". To the right is the FDA logo. In the top right corner, there are links for "FURLS HOME" and "AF/LACF HOME". A progress bar at the top indicates steps from Step 01 to Step 10, with Step 02 highlighted in orange and marked with ">>>>". Below the progress bar, the text "SECTION B GOVERNING REGULATION" is displayed in a dark grey box. Underneath, there is a instruction: "Refer to the precursor questions in the instructions." and a checked checkbox labeled "Low-acid (21 CFR 108.35 and 21 CFR Part 113)". A "Get Help" link with a question mark icon is located in the top right corner of the form area.

I. Step 3 – Section C. Container Type

Each different container type and each different size of the same container type should be filed as a separate Form FDA 2541g. Therefore, for any Form FDA 2541g that you submit, select a single container type. To submit additional container types and/or different container sizes for the same product, you may copy the form for the product in one container type and size and then edit the information on that form to reflect a different container type and/or size. (See Ref. 2 for instructions on how to copy a form.) For technical information about container types, refer to Appendix – A, Container Types and Shapes.

Figure 15 shows a picture of an example of a computer screen displaying container types available in Step 3 (Section C).

Figure 15 – Step 3 (Section C) Container Type

The screenshot shows the AF/LACF web application interface. At the top, there is a header with the AF/LACF logo, the text 'Acidified/Low Acid Canned Foods', and the FDA logo. A progress bar indicates the current step is Step 03. The main content area is titled 'SECTION C CONTAINER TYPE'. It includes a note about file size and types, a 'Clear' button, and a 'Select one:' section with four radio button options: 'Aluminium/Tinplate/Steel Can', 'Flexible Pouch', 'Semi-Rigid', and 'Other'. Under 'Flexible Pouch', there is a sub-question 'a) What is the shape of the container?' with a dropdown menu set to 'Flat Pouch'. At the bottom, there are buttons for '<< Back', '>> Save & Exit', '>> Continue', and '<< Cancel & Start Again'.

1. Aluminum/Tinplate/Steel Can

The first container type listed on Form FDA 2541g is for a container of all non-flexible metal (i.e., aluminum,³ tinplate, or steel can). Do not select Aluminum/Tinplate/Steel Can if the container combines metal in one layer with other materials (e.g., paperboard or a polymer) in other layers.⁴

a) What is the shape of the container?

Select the shape that best applies to the container. If the container is asymmetrical in shape, select “Irregular” and attach a picture or schematic. If none of the shapes apply, select “Other” and attach a picture or schematic. See section II.C of this document for instructions on how to attach a document.

b) How many pieces are used to construct the container?

A 2-piece container is a container where one end is made as part of the can body. There is no side seam and only one end is attached through the formation of a double seam.

³ Note that we consider an aluminum can to be a non-flexible metal container rather than a semi-rigid container.

⁴ Note that we consider a combination of metal and other material containers to be a retortable paperboard or semi-rigid container.

A 3-piece container consists of a can body and two attached ends. A 3-piece container can be identified by the presence of a side seam. The side seam runs the length of the cylinder from one end to the other. Side seams are either cemented or welded.

You may select either “2-piece container”, “3-piece container” or both, as applicable.

At this stage in the data entry process, you can either select “Save and Exit” or select “Continue” to go on to Step 4 (Section D).

2. Flexible Pouch

The second container type listed on Form FDA 2541g is for a container of flexible material.

A flexible pouch is a food container that has no fixed shape. Its final shape is defined by the product placed inside it during the filling and sealing process. It is constructed of flexible panels composed of laminated polymers. The composition of laminated polymers varies depending on the food product, the processing method, and the intended use. Some flexible pouches contain a foil layer.

a) What is the shape of the container?

Select the shape that applies to the container. For “Irregular” or “Other” shapes, attach a picture or schematic of the pouch. See section II.C of this document for instructions on how to attach a document.

At this stage in the data entry process, you can either select “Save and Exit” or select “Continue” to go on to Step 4 (Section D).

3. Semi-Rigid

The third container type listed on Form FDA 2541g is for a container of semi-rigid material.

A semi-rigid container is a container where the shape of the container is not altered by filling of product at atmospheric pressures---but can be altered by additional external pressure.

a) What is the shape of the container?

Select the shape that best fits the container. For “Irregular” or “Other” shapes, attach a picture or schematic. See section II.C for instructions on how to attach a document.

b) Is this a single-piece container?

If the container is made of one piece of material and the ends are fused, select “Yes” and continue to question d. Otherwise, select “No” and continue to question c.

c) Is this a compartmentalized container?

Compartmentalized containers are containers that hold more than one food product (e.g., baby food consisting of corn and baby food consisting of green beans where the corn and green beans are held in separate sections within a single container) and the food is processed in the single container.

If the container consists of more than one compartment and the compartments contain different food products, select “Yes” and identify the number of compartments. Otherwise, select “No.”

d) What is the predominant material used to make the body of the container?

Select the material that, based on weight, is the predominant material used to make the container stock. If you select “Other,” enter the information next to “Other.”

If you selected “Yes” to question 3.b (indicating that you use a single-piece container), skip the remaining questions under this section and continue to Step 4 (Section D.) Otherwise, continue with questions e and f.

e) What is the predominant material used to make the lid of the container?

Select the material that, based on weight, is the predominant material used to make the lid stock. If you select “Other,” enter the information next to “Other.” If the container is a web fed paperboard brick pack, without a lid, select “Not Applicable.”

f) How is the lid sealed to the body of the container?

Select the appropriate mechanism for how the lid is sealed to the body of the container. If you select “Other,” enter the information next to “Other.” If the container is a web fed paperboard brick pack, without a lid, select “Not Applicable.”

At this stage in the data entry process, you can either select “Save and Exit” or select “Continue” to go on to Step 4 (Section D).

4. Other Container

The fourth container type listed on Form FDA 2541g is for a container of a type other than the ones listed above.

Select “Other” when none of the container types listed on the form applies and enter the container type.

a) Attach a schematic or picture of the container. See section II.C of this document for instructions on how to attach a document.

b) Specify the material that, based on weight, is the predominant material used to make the container stock. This is the material that constitutes the highest weight value of the container stock.

c) Specify the material that, based on weight, is the predominant material used to make the lid stock. This is the material that constitutes the highest weight value of the lid stock. If the container does not have a lid, specify Not Applicable.

d) Specify the method used to seal the lid to the body. If the container does not have a lid, specify Not Applicable.

At this stage in the data entry process, you can either select “Save and Exit” or select “Continue” to go on to Step 4 (Section D).

J. Step 4 – Section D. Container Size

Step 4 (Section D) includes information on Container Size. You are required to complete D.1 (Dimensions); however, volume is acceptable for container size in lieu of container dimensions if package sterilizer does not depend on the container dimensions. Section D.3 (net weight) is optional. Products come in a variety of container shapes (see section II.I of these instructions for information about container shapes). For cylindrical (including bowl and oval) shapes, select “a” to report the container size. For rectangular (including trays) shapes, irregular shapes, or pouches, select “b” to report the container size. Report container dimensions in English units (number of whole inches and sixteenths of an inch). Figure 16 displays a picture of a computer screen for data entry of the container dimensions.

Refer to Appendix – B, Container Dimension Measurements for examples.

Figure 16 – Step 4 (Section D) Container Size

The screenshot shows a web-based data entry form for 'AF/LACF Acidified/Low Acid Canned Foods'. At the top, there is a progress bar with steps 01 through 08, where Step 04 is highlighted. The form title is 'SECTION D CONTAINER SIZE'. A note states: 'Note: Section D.1 (dimensions) is required information; however, volume is acceptable for container size in lieu of container dimensions if package sterilizer does not depend on the container dimensions. Section D.3 (net weight) is optional information.' Below the note is a 'Clear' button. The form contains three main sections: 1. Dimensions: with a dropdown for 'b)' and input fields for Length, Width, and Height/Thickness. 2. Volume: with input fields for '16' and '.4' and a dropdown for 'Fluid Ounces'. 3. Net Weight (Optional): with input fields for weight and a note '(enter in ounces)'. At the bottom, there are four navigation buttons: '<< Back', '>> Save & Exit', '>> Continue', and '<< Cancel & Start Again'.

1. Dimensions:

a) Diameter and Height.

Enter information for Diameter and Height only for cylindrical (including bowl and oval) shaped containers.

b) Length, Width and Height/Thickness.

Enter information for Length, Width, and Height/Thickness for container shapes other than cylindrical.

When entering dimensions for diameter, length, width, and height/thickness, express the dimensions by creating a round number that is a code reflecting the dimensions in inches. The first part of the code represents the whole number of inches and the last two digits represent the fraction of an inch in sixteenths. For example:

- If the dimension is 12 and 8/16 inches, create the code from 12 and 08 – i.e., 1208.
- If the dimension is 5 and 15/16 inches, create the code from 5 and 15 - i.e., 515.
- If the dimension is 3 and $\frac{3}{4}$ inches, first express the $\frac{3}{4}$ inches in sixteenths - i.e., 12/16. Then create the code from 3 and 12 - i.e., 312.
- If the dimension is 4 inches, create the code from 4 and 00 - i.e., 400.
- If the dimension is 4 and 1/8 inches, first express the 1/8 inches in sixteenths - i.e., 2/16. Then create the code from 4 and 2 - i.e., 402.

Rounding may be necessary for sizes that are less than one sixteenth of an inch. Rounding can be up or down depending on the measurement. If the measurement is closer to the “higher” sixteenth, round up; if the measurement is closer to the “lower” sixteenth, round down. For example:

- If the diameter is 3 and 7/16 inches and the width is 2 inches and 1/4 of one 16th inches, the rounded dimensions will be 307 x 200
- If the diameter is 4 5/16 inches, the width 3 and 1/16 inches, and height is 0.906 (14/16ths and 1/2 of one 16th of an inch), the rounded dimensions will be 405 x 301 x 015

2. Volume:

Enter the volume using a maximum of three digits before the decimal point and one digit after the decimal point and select the applicable units.

3. Net Weight (Optional):

This question provides the opportunity for you to include the net weight of your product. Although you are not required to enter this information on this filing form, entering the

information can help FDA inspectors examining product in matching a product under examination to the product described in this filing form.

Only the quantity of food in the container or package is stated in the net quantity statement. Do not include the weight of the container, or wrappers and packing materials. To determine the net weight, subtract the average weight of the empty container, lid and any wrappers and packing materials from the average weight of the container when filled with food.

Enter the net weight in ounces if you choose to provide this optional information using a maximum of three digits before the decimal point and two digits after the decimal point.

At this stage in the data entry process, you can either select “Save and Exit” or select “Continue” to go on to Step 5 (Section E).

K. Step 5 – – Section E. Product Processing Method

Processing method is a general description of how the food product is rendered commercially sterile before being aseptically filled into the container. Note that in Section E. you provide information only about the processing method (including the sterilization system) for the product itself and not about the sterilization system for the package. You provide information about the package sterilization system in Step 7 (Section G.) Figure 17 shows a picture of an example of a computer screen displaying Section E – Processing Method.

Figure 17 - Step 5 (Section E) Processing Method

SECTION E PRODUCT PROCESSING METHOD: THERMALLY PROCESSED USING ASEPTIC SYSTEMS

Note: The maximum allowed file size is 50 MB. The accepted file types include the following: jpg,doc,docx,txt,xls,lsx,pdf,gif and rtf.

>> Clear

1. Product Sterilization:

a. What is the finished equilibrium pH of the product after processing? 4 . 7

b. Heating Method

i. Direct Heating

ii. What is the Thermal Expansion Coefficient? 3 . 88

iii. Where is the product flow rate controlled? After the heater

c. What is the Manufacturer's name and the model number of the Product Sterilization System?
ABC Manufacturing Corp, Model 5

d. What is the Process Source of the Product Sterilization System?
AAA Technical Corp

Attach Process Source document:

	File Name	File Size (MB)	
1	source_20140723140528550.doc	0.0215	Remove
Total Size:		0.0215	

e. What is the date of the Process Source Document of the Product Sterilization System (mm/dd/yyyy)?
07/03/2012

<< Back >> Save & Exit >> Continue
<< Cancel & Start Again

1. Product Sterilization System

a) What is the finished equilibrium pH of the product after processing?

Enter the representative pH of the product after processing using a maximum of two digits before the decimal point and two digits after the decimal point. We consider this pH value to be an average of a range between the low and high pH of the standard product. In instances where there is no decimal value, the decimal portion will be two zeros.

b) Heating method

Answer the following questions regarding your heating method.

Question b.i: Direct Heating or Indirect Heating?

The product may be heated directly by steam introduced into the product stream or indirectly by steam/water separated from the product by a physical barrier. If steam is introduced directly into the product stream, select “Direct Heating.” If steam/water is

separated from the product by a physical barrier (e.g., plate, tube, shell, coil), select “Indirect Heating.”

Question b.ii: What is the Thermal Expansion Coefficient?

Thermal expansion is the tendency of matter to change in volume in response to a change in temperature. The degree of expansion divided by the change in temperature is called the material’s coefficient of thermal expansion. Enter the value using one digit before the decimal point and two digits after the decimal point.

Question b.iii: Where is the product flow rate controlled?

Before the heater: Select “Before the heater” if the product flow rate is controlled before the heater. If you select “Direct heating” under Section E.1.b.i, continue to question E.1.b.iii.1. If you selected “Indirect heating” under Section E.1.b.i, continue to question E.1.c.

After the heater: Select “After the heater” if the product flow rate is controlled after the heater and continue to question c.

Question b.iii.1: Volume Expansion Factor: You should only answer this question if you answered “Before the heater” under Section E.1.b.iii and “Direct Heating” under Section E.1.b.i. Volume expansion is the amount of expansion that occurs due to the addition of steam to the product during direct heating. When direct heating is selected and the flow rate is controlled before the heater, enter the volume expansion factor using one digit before the decimal point and two digits after the decimal point.

c) What is the Manufacturer’s name and the model number of the Product Sterilization System?

Enter the manufacturer’s name and the model number of the product sterilization system.

d) What is the Process Source of the Product Sterilization System?

The process source is the individual or entity (e.g., organization, company, individual, university, or other entity) that establishes the scheduled process. In the case of low-acid foods processed using aseptic systems, the scheduled process identifies the product sterilization system. Scheduled processes for low-acid foods must be established by qualified persons having expert knowledge of thermal processing requirements for low-acid foods in hermetically sealed containers and having adequate facilities for making such determinations.

Enter the name of the process source who scientifically established the scheduled process(es) for the product sterilization system and attach the support documentation containing the process recommendations (e.g., letter, bulletin, scientific paper). You may

refer to 21 CFR 113.83 for more detailed requirements concerning establishing scheduled processes. Below, we provide some examples of how to name the process source of the product sterilization system.

- If the process was established by your facility, enter the facility's name.
- If the process was established by an organization, individual, university or other entity, enter the name of that entity (followed by the name of an individual, as appropriate).
- If the process was established by a reference source document or publication, enter the reference source document.

e) What is the date of the Process Source Document of the Product Sterilization System?

Enter the date of the product sterilization system process source document that is attached in month/day/year format.

At this stage in the data entry process, you can either select "Save and Exit" or select "Continue" to go on to Step 6 (Section F).

L. Step 6 – Section F. Product Critical Factors

In Step 6 (Section F) of the form, you provide information about critical factors for the product. (Note that this is distinct from the Supplemental Submission Attachment for Form FDA 2541g, which is part of Step 7 (Section G) of the form, in which you provide information about critical factors associated with the product sterilization system, any aseptic surge tank, and the package sterilization system.) Under 21 CFR 113.3(f), critical factor means any property, characteristic, condition, aspect, or other parameter, variation of which may affect the scheduled process and the attainment of commercial sterility. Part 113 requires that the processing of low-acid canned foods be done in a manner that ensures that commercial sterility is achieved. Figure 18 shows a picture of an example of a computer screen for Step 6 (Section F) (product critical factors).

1. Does the product contain particulates?

Particulates are any solid or semi-solid pieces that may erode or diminish during processing, but are still discernable in the finished product. If the product contains particulates, select "Yes," provide the support documentation and validation reports, and continue to question F.1.a. Otherwise, select "No" and continue to question F.2.

a) Is controlling particulate size a critical factor?

Some particulates are naturally limited in size (e.g., rice, beans, peas, corn kernels) or mechanically modified in size (e.g., cut, diced). If failing to control the size could impact the thermal process or heat transfer to the particle, select "Yes" and continue to question F.1.b. Otherwise, select "No" and continue to question F.2.

b) What is the shape and maximum dimension of the particulate size to be controlled? If more than one, list all that apply.

Enter the dimensions (maximum and/or minimum, as applicable) of the particle size to be controlled, its unit of measure, and the food component to which the limitation applies (e.g., “cuts $\geq 1/4$ inch”; shrimp sizes such as “small”; “minimum slice thickness $\geq 3/16$ inch”; fish balls “maximum diameter $3/4$ inch”; stuffed pasta tube “maximum 2 inch length by $1/2$ inch diameter” etc.).

2. Does the product contain any dry ingredients that are hydrated before processing the product?

If your product contains dry ingredients that are hydrated before processing the product, select “Yes” and continue to question F.2.a. Otherwise, select “No” and continue to question F.3.

a) What is the minimum % moisture of the hydrated dry ingredients before processing?

For the dry ingredients that are hydrated before processing, enter the minimum percent moisture of the ingredients after they have been hydrated but before the product has been processed. Enter the percent moisture using a maximum of two digits before the decimal point and two digits after the decimal point.

3. Does the % total solids affect the heating of the product during processing?

In some processes, the amount of solids in the product can impact the thermal process. If the percent total solids affect the thermal process, select “Yes” and continue to question F.3.a. Otherwise, select “No” and continue to question F.4.

a) What is the % total solids?

Enter the maximum percent total solids in the product that is critical to the process using a maximum of two digits before the decimal point and two digits after the decimal point.

4. Is the finished equilibrium pH of the product after processing (identified in Section E) critical to the process?

In some instances, the thermal process delivered to a low-acid food product is calculated based upon the pH of the finished product. If pH is critical to the thermal process of the product, select “Yes.” Otherwise, select “No.”

5. What is the flow correction factor used during the scheduled process?

Select one of the two available choices. If the product exhibits a laminar flow/transitional flow ($Re < 4000$), select “0.5 (Laminar)” and continue to Section G. If the product exhibits a turbulent flow ($Re > 4000$), select “0.83 (Turbulent)” and continue to question F.6.

6. Answer the following questions if the flow correction factor you identified in question F.5 is 0.83 (Turbulent):

a) What is the instrument used to measure the consistency/viscosity?

Enter the instrument used (e.g., Brookfield).

b) What is the temperature when you measure the consistency/viscosity?

To obtain an accurate measurement of consistency/viscosity, you should make your measurement at the temperature recommended by the manufacturer of the instrument used to measure the consistency/viscosity. Enter the product temperature in degrees Fahrenheit when you measure the consistency/viscosity using a maximum of three digits before the decimal point and one digit after the decimal point.

c) What is the consistency/viscosity? What is the unit of measure?

Enter the measured value using a maximum of three digits before the decimal point and two digits after the decimal point and select the appropriate units measured. If you select “Other,” enter the units of measure next to “Other.”

Examples of other units of measure:

- Pascal-second (Pa.s)
- Saybolt Seconds Universal (SSU)
- Stokes (St)

d) What is the specific gravity?

Enter the specific gravity using one digit before the decimal point and four digits after the decimal point.

7. Is starch added to maintain consistency/viscosity of the product?

If starch is added to achieve a desired consistency/viscosity, select “Yes” and continue to questions F.7.a-F.7.b. Otherwise, select “No” and continue to question F.8.

a) What is the maximum % starch added?

Enter the maximum percent starch of the total product formula weight using a maximum of two digits before the decimal point and two digits after the decimal point.

b) What type of starch is added?

Enter the type of starch added to the product.

Examples of starch types:

- Modified Corn starch
- Potato starch

8. Are other binders added?

If binders other than starch are added to the product to achieve a desired consistency/viscosity, select “Yes” and continue to questions F.8.a-F.8.b. Otherwise, select “No” and continue to question F.9.

a) What is the maximum % binder added?

Enter the maximum percent binder of the total product formula weight using a maximum of two digits before the decimal point and two digits after the decimal point.

b) What type of binder is added?

Enter the type of binder added to the product.

Examples of binder types:

- Gelatin
- Xanthan Gum

9. Is syrup strength a critical factor that needs to be controlled during processing?

Syrups are included as ingredients in many products to achieve a desired taste and sensory quality. If adding syrups is critical to how the product heats, select “Yes” and continue to question F.9.a. Otherwise, select “No” and continue to Section G – Package Sterilization System and Supplemental Information.

a) What is the brix measurement?

Degree Brix is the % sugar, by weight, of an aqueous solution. Enter the maximum degrees (Brix) to the nearest one decimal place of a degree (e.g., 30.0) using a maximum of two digits before the decimal point and one digit after the decimal point.

At this stage in the data entry process, you can either select “Save and Exit” or select “Continue” to go on to Step 7 (Section G).

SECTION F PRODUCT CRITICAL FACTORS

Note: The maximum allowed file size is 50 MB. The accepted file types include the following: jpg, doc, docx, txt, xls,xlsx, pdf, gif and rtf.

Complete all product critical factor questions as delineated by process authority to assure commercial sterility.

>> Clear

1. Does the product contain particulates? Yes No

2. Does the product contain any dry ingredients that are hydrated before processing the product? Yes No

3. Does the % total solids affect the heating of the product during processing? Yes No

4. Is the finished equilibrium pH of the product after processing (identified in Section E) critical to the process? Yes No

5. What is the flow correction factor used during the scheduled process? 0.5 (Laminar) ▼

M. Step 7 – Section G. Package Sterilization System and Supplemental Information

In Step 7 (Section G) of the form, you provide (1) information about the package sterilization system and (2) an attachment called a “Supplemental Submission Attachment for FDA Form 2541g” (“Supplemental Submission”). With respect to questions G.1.a.-G.1.c, you may enter information for up to four individual package sterilization systems. Refer to Appendix C for more information about the Supplemental Submission. Figure 19 shows a picture of a computer screen for Step 7 (Section G).

Figure 19 - Step 7 (Section G) Package Sterilization System and Supplemental Information

SECTION G PACKAGE STERILIZATION SYSTEM AND SUPPLEMENTAL INFORMATION

Note: The maximum allowed file size is 50 MB. The accepted file types include the following: jpg, doc, docx, txt, xls, xlsx, pdf, gif and rtf.

>> Clear

1. Sterilization System

a) What is the Manufacturer name and the model number of the sterilization system used to sterilize the packaging of the product?

b) What is the Process Source of the Package Sterilization System?

c) What is the date of the Process Source of the Package Sterilization System (mm/dd/yyyy)?

d) Supplemental Submission Identifier (SUP SID):

Attach Supplemental Information:

	File Name	File Size (MB)	
1	Sup SID Critical Factors 20140723142209974.xls	0.0303	Remove
Total Size:		0.0303	

<< Back >> Save & Exit >> Continue
 << Cancel & Start Again

1. Sterilization System

a) What is the Manufacturer name and the model number of the sterilization system used to sterilize the packaging of the product?

Enter the Manufacturer’s name and the model number of the sterilization system used to sterilize the packaging and used to fill the product while in the sterile environment.

b) What is the Process Source of the Package Sterilization System?

The process source is the individual or entity (e.g., organization, company, individual, university, or other entity) that establishes the scheduled process for the package sterilization system. Scheduled processes for aseptic package sterilization systems must be established by qualified persons having expert knowledge of thermal processing requirements for low-acid foods in hermetically sealed containers and having adequate facilities for making such determinations.

Enter the name of the process source who scientifically established the scheduled process(es) for the package sterilization system and attach the support documentation containing the process recommendations (e.g., letter, bulletin, scientific paper). You may refer to 21 CFR 113.83 for more detailed requirements concerning establishing scheduled processes. Below, we provide some examples of how to name the process source of the package sterilization system.

- If the process was established by your facility, enter the facility’s name.
- If the process was established by an organization, individual, university or other entity, enter the name of that entity (followed by the name of an individual, as appropriate).
- If the process was established by a reference source document or publication, enter the reference source document.

c) What is the date of the Process Source Document of the Package Sterilization System?

Enter the date (using the format month/day/year) of the process source of the package sterilization system.

d) Supplemental Submission Identifier (SUP SID): ____-__-__-____

The Supplemental Submission Identifier (SUP SID) is a code identifying the “Supplemental Submission” that you submit as a supplement to Form FDA 2541g. The Supplemental Submission serves to provide a more in-depth description of the sterilization system. You may attach up to four Supplemental Submissions to a single Form FDA 2541g if a single product sterilization system feeds into more than one packaging sterilization system. See “Appendix C, Supplemental Submission Attachment for FDA Form 2541g” for instructions on how to create a SUP SID code for the Supplemental Submission, information about what to include in a Supplemental Submission, and recommendations for software programs that can help you present the information.

At this stage in the data entry process, you can either select “Save and Exit” or select “Continue” to go on to Step 8 (Section H).

N. Step 8 – Section H. Scheduled Process

Under 21 CFR 113.3(r), scheduled process means the process selected by the processor as adequate under the conditions of manufacture for a given product to achieve commercial sterility. The scheduled process, which is the process established by a qualified process source as described in sections II.K.1.d and II.M.1.b of this document, may be in excess of what is necessary to ensure destruction of microorganisms of public health significance.

List each process on a single line, except if your processing system utilizes a hold tube that varies in internal diameter along the length of the hold tube. If your hold tube has more than one section and each section has a different internal diameter, enter information about each hold tube section on a separate line. Refer to Figure 23 which shows how multiple hold tube sections are identified.

The system will identify columns that do not apply and “grey them out” (i.e., make them unavailable for data entry). In the instructions, we identify the required data entry in the applicable columns.

To add additional rows for the columns available, select “Add Row” at the top of the screen. The screen will display a new row for the user to enter another process or continue for a multiple step process. After all entries have been added, you can either select “Save and Exit” or select “Continue” to navigate to the Confirmation screen. Figure 20 shows a picture of an example of computer screen for Step 8 (Section H).

Figure 20 - Step 8 (Section H) Scheduled Process

Col.1	Col.2	Col.3	Col.4	Col.5	Col.6	Col.7	Col.8	Col.9
Process No.	Hold Tube Section	Inside Diameter of Hold Tube Section	Hold Tube Section Length	Initial Temperature (*only for heating with control of flow rate before the heater)	Process Time	Temperature (at exit of final hold tube section)	Fo (F18/250)	Maximum Product Flow Rate
Number	Number	Inches	Inches	° Fahrenheit	Seconds	° Fahrenheit	Minutes	Gal/min
1	1	2 .375	376 .8	, ,	3 .61	285 .	5 .2	60 . .

1. Column 1. Process No.

Each process has its own process number. Enter the number 1 in the first row, the number 2 in the second row, and continue entering numbers in increments of 1 for each scheduled process that you list. The process number increases by increments of 1 regardless of the number of holding tube sections in each scheduled process.

2. Column 2. Hold Tube Section

If your hold tube has the same internal diameter for its entire length, enter the number 1. If the internal diameter varies along the length of the hold tube, enter 1 on the first line, 2 on the second line, and continue entering numbers in increments of 1 for each variation in internal diameter along the length of the hold tube. We list below some examples of how to provide this information.

Figure 21 - Single Process, Single Hold Tube Section and Fo

Col. 1	Col. 2	Col. 3	Col. 4	Col. 5	Col. 6	Col. 7	Col. 8	Col. 9

Process No.	Hold Tube Section	Inside Diameter of Hold Tube Section	Hold Tube Section Length	Initial Temperature (*only for heating with control of flow rate before the heater)	Process Time	Temperature (at exit of final hold tube section)	Fo (F18/250)	Maximum Product Flow Rate
Number	Number	Inches	Inches	°Fahrenheit	Seconds	°Fahrenheit	Minutes	Gal/min
1	1	1.90	500.000	----	5.26	282.0	5.00	35.00
2	1	1.90	500.000	----	4.60	283.0	5.00	40.00
3	1	1.90	500.000	----	4.09	284.0	5.00	45.00
4	1	1.90	500.000	----	3.68	285.0	5.00	50.00

Figure 23 - Single Process with Multiple Hold Tube Sections with Different Diameters/Lengths

Col. 1	Col. 2	Col. 3	Col. 4	Col. 5	Col. 6	Col. 7	Col. 8	Col. 9
Process No.	Hold Tube Section	Inside Diameter of Hold Tube Section	Hold Tube Section Length	Initial Temperature (*only for heating with control of flow rate before the heater)	Process Time	Temperature (at exit of final hold tube section)	Fo (F18/250)	Maximum Product Flow Rate
Number	Number	Inches	Inches	°Fahrenheit	Seconds	°Fahrenheit	Minutes	Gal/min
1	1	1.26	160.00	165.0	0.46		0.68	
1	2	1.95	425.00	----	2.94	283.0	4.32	50.00
1							5.00	

3. Column 3. Inside Diameter of Hold Tube Section

List the internal diameter of the hold tube in inches using one digit before the decimal point and three digits after the decimal point. When the diameter is less than an inch, enter zero as the digit before the decimal point. If the internal diameter varies along the length of the hold tube, list the internal diameter for each section as illustrated in Figure 23.

4. Column 4. Hold Tube Section Length

List the hold tube length in inches using a maximum of four digits before the decimal point and three digits after the decimal point. If the internal diameter varies along the length of the hold tube, list the hold tube length for each section of the hold tube as illustrated in Figure 23.

5. Column 5. Initial Temperature

Fill out this column only if you selected “Direct Heating” in Step 7 (Section E.1.b.i) and “Before the heater” in Step 7 (Section E.1.b.iii) of the form. Enter the initial temperature at the beginning of the first heater in the product flow stream before the hold tube. If the internal diameter varies along the length of the hold tube, enter the initial temperature for the first section only, as illustrated in Figure 23. Enter this temperature in degrees Fahrenheit using a maximum of three digits before the decimal point and one digit after the decimal point. Otherwise, continue to column 6 on the form.

6. Column 6. Process Time

Enter the duration of the process time for each hold tube section in the scheduled process in seconds and fractions of a second using a maximum of three digits before the decimal point and three digits after the decimal point. If the duration is a whole second, enter the number of seconds and three zeros for the decimal portion. If the internal diameter varies along the length of the hold tube, enter the process time for each hold tube section, as illustrated in Figure 23.

Examples of how to enter process time:

- If the process time is 15 seconds and 0 fractions of a second, enter 15.000
- If the process time is 15 seconds and a quarter of a second, enter 15.250
- If the process time is 1 minute and 15 seconds, enter 75.000

7. Temperature (at exit of final hold tube section)

Enter the temperature at the exit of the hold tube in degrees Fahrenheit using a maximum of three digits before the decimal point and one digit after the decimal point. If the internal diameter varies along the length of the hold tube, do not enter the temperature at the exit of each hold tube section; instead, only enter the temperature at the exit of the final hold tube in the final section as illustrated in Figure 23.

8. Column 8. Fo (F18/250)

Enter the number of minutes that the process requires to achieve commercial sterility using a z value of 18 degrees Fahrenheit and a reference temperature of 250 degrees Fahrenheit. This is the Fo value. If the internal diameter varies along the length of the hold tube, enter the Fo value for each hold tube section. After you have entered Fo values for each hold tube section, add the values together and in a new row, enter in column 1 the same process number for that process and in column 8 the total accumulated Fo from all the hold tubes. Refer to Figure 23 for an example. For each Fo value, enter the number of minutes using a maximum of two digits before the decimal point and two digits after the decimal point.

Examples of how to enter the Fo:

- 6.00
- 6.35

9. Column 9. Maximum Product Flow Rate

Enter the maximum product flow rate in gallons per minute at the hold tube outlet using a maximum of two digits before the decimal point and two digits after the decimal point. If the internal diameter varies along the length of the hold tube, enter the maximum product flow rate in the final section, as illustrated in Figure 23.

10. Add more entries:

To add additional rows to Step 8 (Section H), select the “Add Row” button located at the top left hand side of the screen and continue adding information under the appropriate columns. After you complete all the column entries, select “Continue” to navigate to the Review screen for comments and additional attachments.

11. Full Name, Signature, Establishment Name and Date

The system will automatically enter this information based on your FIS Account (i.e., person authorized to represent the facility, the date of the form submission, authorized person’s telephone number) and the FCE facility information (i.e., facility name, state (for US) or province (for foreign countries), country). Because the electronic system automatically enters this information in the form, the system will skip Step 11 and displays the Comment and additional attachment section on the Review screen. Figure 26 shows an example of a computer screen displaying Step 11 (i.e., name and date) above the comment box.

O. Review Step

The review step provides an opportunity for you to review all the information supplied for the process filing and to add additional attachments (such as schematics of irregular shaped containers) that were not attached in Steps 1 through 7 (Section A through G). See section II.C of this document for instructions on how to attach a document. Since all

the information covers more than a single screen, use the Page Down, Page Up, or scroll bar to the right and bottom of the browser screen to view the information on multiple screens. The review step also provides an opportunity for you to provide any other information you consider pertinent to the product and/or the scheduled process critical factor(s) in a comment box.

P. Step 9 – Section I. Additional Information (Optional)

Under this section of the form, you may provide optional attachments. Select one or more choices and identify the document name adjacent to the appropriate choice(s).

1. Comments and Additional Attachments:

Enter any additional information you consider pertinent to the product and/or the scheduled process critical factor(s). Comments are optional unless you report multiple forms of the product, multiple packing mediums, or multiple product variations, in which case comments may be required in some circumstances as discussed under section II.A (General Information) in this document. The Comment text box allows up to 4,000 characters.

If you report multiple forms of a product (e.g., diced, chunks, cut, fillet), multiple packing mediums, or multiple products with minor formulation changes on a single form, the heat transfer rates may differ for each product variation. In such cases, the process for the slowest heating formulation of the product or its packing medium must be filed and you should use the comment box section to specify which formulation packing medium heats the slowest.

If you consider any additional information pertinent to the product and/or the scheduled process critical factor(s), enter that information in the comment box and/or attach one or more documents containing the additional information (see section II.C of this document for instructions on how to attach a document).

Figure 24, Figure 25, Figure 26, Figure 27, and Figure 28 show a complete example of the confirmation screen.

You can return to any previous step to edit information in that step by selecting the applicable “Edit” button adjacent to the Step (Section) on the review screen.

After reviewing the information and adding any applicable attachments and/or comments, you can select (1) Cancel the process filing; (2) Save and Exit to Draft Folder; or (3) Submit the process filing to FDA.

After reviewing the information on the review screen, editing information if appropriate, and adding any applicable attachments or comments, you can either:

- Select “Cancel and Start Again” to start over without saving any information;
- Select “Save and Exit” to save the process filing form to the Draft Folder without sending it to FDA. Process filings in the Draft Folder remain available to the user who creates them and to users authorized as the ECP or a Super AR (see the Appendix section of Ref. 2 for information about user roles). Process filings in the Draft Folder cannot be viewed by FDA or by users other than the ECP and Super AR for an FCE; or
- Submit the completed process filing form to FDA.

P. Filing Message

After you select Submit, the system will provide a message that your form has been successfully filed. Figure 29 shows a picture of an example of the message screen informing a user that a process filing has been submitted for a particular FCE. This message screen specifies the SID assigned to the submitted process filing form.

Figure 29 - System Display of Successful Message of a Filed Process Filing Form

You can select either:

- Return to Folder Menu to return to the FCE Process Filing Folder Main Menu;
- Return to Main Menu to return to the AF/LACF Main Menu; or
- View Process Filing to view the submitted process filing. When you view the submitted process filing, you can print it.

Figure 40 – Semi Rigid Body with Heat Seal

B. Container Dimension Measurements

Container dimension measurements should always be measured from the outside edge of the container. Below, we list different types of materials and descriptions of how to properly measure the dimensions of the container.

1. Cylindrical Measurement

Measure the diameter from the outside of the double seam on the container. Measure the height from the top of the double seam to the opposing double seam top. If the can is a two piece can, measure from the top of the double seam to the furthest point on the other end. For glass bottles or unusually shaped cylindrical containers, always measure the widest part of the container.

For heat-sealed, semi-rigid containers, do not measure the sealing flange as part of the container dimensions. Only measure from the inner edge of the flange where the seal edge meets the chamber holding the food.

When measuring cylindrical shaped containers, list diameter x height (e.g., 0211 x 0400 for a 2 11/16 inch x 4 inch container).

Figure 41 – Measurement of a Cylindrical Shape Container.

When measuring unusually shaped cylindrical containers, always measure the widest part of the container.

Figure 42 – Measurement of an Unusual Shape Cylindrical Container.

2. Oval Shape Measurement

When measuring unusually shaped oval containers, always measure the widest part of the container.

Figure 43 – Measurement of an Oval Shape Container

Figure 44 – Measurement of Outer Edges of Container

3. Rectangular Shape, Rectangular Tray and Low-Profile Measurement

For all rectangular containers (including trays), list length (longest dimension) x width (second longest dimension) x height; for example, list 0405 x 0301 x 0014 for a container that is 4 5/16 inches long, 3 1/16 inches wide, and 14/16 of an inch.

For a rectangular can, measure the length and width from outside of the double seam. When measuring the height of the container, measure from the top of the double seam to the furthest point on the bottom.

For a rectangular pouch, measure from the inner edge of the seams for the length and width. For the height, measure the thickness at the thickest point.

For paper board rectangular containers, measure the length, width, and height from the outside edge of the container.

4. Rectangular Shape Measurement

Figure 45 – Measurement of a Rectangular Shape Container

5. Rectangular Tray Measurement

Figure 46 – Measurement of a Rectangular Tray Shape Container

6. Low-Profile Measurement

Figure 47 – Measurement of a Low-Profile Container

C. Supplemental Submission Attachment for Form FDA 2541g

1. Food Canning Establishment (FCE) Number

Provide the FCE number as described in section II.B.1 in these instructions.

2. Supplemental Submission Identifier (SUP SID)

Aseptic processing involves up to three separate systems: a product sterilization system, an optional aseptic surge tank system, and a package sterilization system. The “Supplemental Submission Attachment for Form FDA 2541g” (“Supplemental Submission”) that you attach to Form FDA 2541g is designed for you to provide detailed information about your product and package sterilization systems, and about your aseptic surge tank system if you use one.

Each Supplemental Submission is identified by a unique identifier, called a “SUP SID.” The SUP SID is a unique number associated with each Supplemental Submission for a facility. You assign the SUP SID. The SUP SID identifies a specific attachment for a packaging system and is attached as a document to a submission which is the

combination of the FCE number and Submission Identifier as described in section II.B.1 and II.B.2 of these instructions.

The SUP SID identifier should be a combination of:

- (1) The date (i.e., year, month, and day of the month) that identifies the date you sent us the Supplemental Submission; and
- (2) A sequence number that would distinguish multiple Supplemental Submissions, each associated with a different product and package aseptic system, submitted on the same date. The sequence number starts with 001 and continues (002, 003, 004) for as long as necessary to uniquely identify each supplemental submission submitted on the same date. Each product and packaging aseptic system will have a unique number.

The SUP SID identifier should use the following format:

YYYY-MM-DD-SSS

Where:

YYYY represents the calendar year (e.g., 2013, 2014)

MM represents the month (e.g., 02 for February, 10 for October)

DD represents the day of the month (e.g., 02, 19, 30)

SSS represents the assigned sequence number (e.g., 001, 002, 003).

Examples of SUP SID identifiers include:

2013-02-22-001: The first Supplemental Submission submitted on February 22, 2013

2013-02-22-002: The second Supplemental Submission submitted on February 22, 2013

2013-02-22-003: The third Supplemental Submission submitted on February 22, 2013

You may only attach the same Supplemental Submission for more than one Form FDA 2541g if the product described in the Form FDA 2541g all use the same product and package sterilization system, as well as the same aseptic surge tank if applicable.

3. General Information about the Supplemental Submission

We recommend that you organize information in your Supplemental Submission in tables to the extent practical. You may find it useful to use a computer spreadsheet program or

a word processing program that helps in creating tables. Refer to Ref. 5 in this document for an example of a table prepared using spreadsheet software.⁵

Unless you or the manufacturer of your package sterilization system has previously submitted a process validation study concerning your package sterilization system to FDA, you must provide a process validation study along with your Supplemental Submission. The process validation study must provide a detailed description of the equipment, package, and the biological challenge study for the package sterilization system. In addition, when a surge tank is used, the process validation study must include a temperature distribution study for the surge tank. When validating an aseptic package sterilization system, we recommend that you follow generally available recommendations and methods such as those provided by the Institute for Thermal Processing Specialists (Ref. 3). The information contained in your process validation study in Metric or English units of measurement, and temperature Fahrenheit. We will review the process validation study for a new aseptic package sterilization system and if we have questions, we will contact you.

We also recommend that equipment manufacturers, process establishments, and Process Authorities meet with us during development and validation of an aseptic package sterilization system (see Section III of this document, entitled “How to Contact FDA or Obtain Help”).

Although your process validation study may be reported in Metric units, you should report the supplemental information described below regarding critical factors for the aseptic sterilization system in English units. For help in converting Metric units to English units, refer to Ref. 4 which provides a link to conversion charts.

4. Critical Factors for the Aseptic Sterilization System

Your Supplemental Submission must include information about critical factors associated with the aseptic sterilization system, including information about critical factors associated with the product sterilization system, the aseptic surge tank if you use one, and the package sterilization system. (Note that this is distinct from Section F of Form FDA 2541g, in which you provide information about critical factors for the product.) Under 21 CFR 113.3(f), critical factors are any property, characteristic, condition, aspect, or other parameter, variation of which may affect the scheduled process and the attainment of commercial sterility. Part 113 requires that the processing of low-acid canned foods be done in a manner that ensures that commercial sterility is achieved. Your Supplemental Submission must identify any critical factors, controls, or other information necessary to

⁵ The information in Ref. 5 has been organized into three categories: 1) information about the FCE and SUP SID numbers; 2) information about critical factors; and 3) signature information. Within the second category (i.e. information about critical factors), information is separately provided regarding the product sterilizer, the aseptic holding tank, and the packaging sterilizer. The information regarding the packaging sterilizer is separately divided to address specifications to achieve commercial sterility and specifications to maintain commercial sterility. This reference is provided as an example only. You are not required to format your information in this way.

achieve and maintain commercial sterility that are specified by the process source for your aseptic sterilization system.

As examples of common critical factors that may apply to product sterilization systems, aseptic surge tanks, and package sterilization systems, we've created the following list. (Note, however, that the list is not intended to be exhaustive, and your product sterilization system, aseptic surge tank, or package sterilization systems may not involve all of these critical factors, or might involve additional critical factors):

- Sterilizing medium
- Temperature
- Time (e.g. exposure time, residence time)
- Pressure (e.g., air pressure, culinary steam supply pressure)
- Sterilizing medium concentration
- Flow rate of sterilizing medium (e.g., high pressure hot water)
- Phase characteristics of sterilizing medium (e.g., vapor, liquid, spray, fog, or mist)
- Relative humidity (e.g., dew point)
- Surface tension
- Elevation
- Removal of sterilizing medium (e.g., removal of chemical residue or condensate)
- Package splicing
- Absence of a container or closure
- Radiation intensity and dose
- Piping and ductwork design
- Presence/absence of optional components or devices such as head space injection
- Event sequence (i.e., activation timing of valve actuators, pumps, heating elements)
- Transition to next state of operation
- Effect of concurrent practices (e.g., product path sterilization concurrent with aseptic zone sterilization)
- Interruptions, short stops and jams

In addition to identifying each critical factor that must be controlled such that the product sterilization system, the aseptic surge tank, or the package sterilization system achieves and maintains commercial sterility, you must also provide all information necessary to assess the control of each specified critical factor. Below, we list examples of such information:

- **Threshold Value** – Identify the critical value that will establish and/or maintain sterility.
- **Limit** – Identify the limit, either maximum or minimum, that you set for each critical factor. The critical limit is set such that if the value is not met, the safety of the product may be questionable.
- **Control/Pen and Ink Diagram (P&ID) Tag** – Identify how this factor is controlled and the labeling number or tag of the instrument used to control each critical factor (e.g., manual, Programmable Logic Computer (PLC) and/or Temperature at Location 1 (T1), Pressure at Location 7 (P7)).
- **Corrective Action** –For each critical factor, describe the procedure(s) that are used when monitoring indicates that the critical limit has not been met.

- Record – Identify the method of recordkeeping used to document that critical factors were controlled (e.g., strip chart, operator log, or electronic record).
- Frequency – Identify the frequency of generating records documenting the control of critical factors (e.g., 15 minute intervals, continuous monitoring, etc).

Sections 4.A. (Product Sterilization System), 4.B. (Aseptic Surge Tank), and 4.C. (Package Sterilization System) describe specific information that you should provide in your Supplemental Submission.

4.A. Product Sterilization System

Specify the Manufacturer's name and model number for the Product Sterilization System. Provide information for each of the critical factors described below, as well as any other critical factors identified by your process source.

Submit information in English units of measurement and temperature in degrees Fahrenheit. For help in converting Metric measurements to English measurements and temperature in degrees Celsius to temperature in degrees Fahrenheit, refer to Ref. 4, which provides a link to conversion charts.

4.A.1. Sterilizing Medium

Specify the sterilizing medium used to achieve commercial sterility in the product sterilization system and all product contact surfaces downstream from the holding tube in the system (e.g., water, steam, hydrogen peroxide, etc.). Refer to Figure 48 or Ref. 5 in this document for examples of how to present this information. If the sterilizing medium is a chemical, specify the threshold value as the minimum concentration of the chemical.

4.A.1.1. Minimum Sterilizing Temperature

Specify the minimum sterilizing temperature used to achieve commercial sterility in the product sterilization system and all product contact surfaces downstream from the holding tube in the sterilization system. Express the temperature in degrees Fahrenheit using a maximum of three digits before the decimal point and one digit after the decimal point.

4.A.1.2. Minimum Time

Specify the minimum time (in minutes) that the sterilizing medium must be recirculated through the product sterilization system to achieve a condition of commercial sterility.

4.A.1.3. Minimum Back Pressure

Specify the minimum back pressure required at the specific location in the product sterilization system to prevent flashing of water to steam (and hence, a reduced holding time in the holding tube). Specify minimum back pressure in pounds per square inch gauge (psig) and location of measurement.

4.A.1.4. Other

Specify any additional critical factors under “Other.” Report any temperatures in degrees Fahrenheit.

A. PRODUCT STERILIZATION SYSTEM:								
ID Number	Description of Critical Factor	Threshold Value	Unit of Measure	Limit	Control/P&ID Tag	Corrective Action	Record	Frequency
1	Sterilizing Medium - Steam	Saturated						
1.1	Minimum Sterilizing Temperature	250	[°F]	min	T1	Product Sterilizer has to be repeated	Strip Chart	Continuous
1.2	Minimum Time	30	[min]	min	PLC		Strip Chart	Continuous
1.3	Minimum Back Pressure	59	[psig]	min	P1		Strip Chart	Continuous
1.4	Other (add additional critical factors and associated details as necessary)							

Figure 48 – Example of SUP SID information for the Product Sterilization System in a Spreadsheet Format

4.B. Aseptic Surge Tank

Surge tanks are sometimes used in aseptic systems to hold sterile product before packaging, especially for systems in which the flow rate of a product sterilization system is much faster than the filling rate of a given packaging unit. If you use an aseptic surge tank, specify the Manufacturer’s name and model number for the Aseptic Surge Tank. Provide information for each of the critical factors described below and any other critical factors identified by your process source.

Submit information in English units of measurement and temperature in degrees Fahrenheit.

4.B.1.1. Minimum Sterilizing Temperature

Specify the minimum sterilizing temperature used to achieve commercial sterility in the aseptic surge tank and all product contact surfaces downstream from the surge tank. Express the temperature in degrees Fahrenheit using a maximum of three digits before the decimal point and one digit after the decimal point.

4.B.1.2. Minimum Time

Specify the minimum time (in minutes) that the sterilizing medium must be recirculated through the surge tank to achieve a condition of commercial sterility.

4.B.1.3. Sterile overpressure to maintain sterility

Sterile overpressure is the amount of positive pressure that must be maintained in the holding tank at all times to consider the surge tank sterile. Specify the sterile overpressure to maintain sterility in pounds per square inch gauge (psig). Specify any critical factors necessary to maintain sterile overpressure (e.g., incineration temperature of air, replacement and/or sterilization frequency for bacteriological filters).

4.B.1.4. Other

Identify any additional critical factors under “Other.” Report any temperatures in degrees Fahrenheit.

4.C. Package Sterilization System

Specify the Manufacturer's name and model number for the Package Sterilization System. Provide information for each of the critical factors described below and any other critical factors identified by your process source.

Submit information in English units of measurement and temperature in degrees Fahrenheit.

- The critical factors in items C.1 through C.5 are used to *achieve* commercial sterility of the specified equipment and package, including the container and closure.
- The critical factors in items C.6 through C.8 are used to *maintain* commercial sterility of the specified equipment and package, including the container and closure.
 - a. *Critical factors used to achieve commercial sterility*

4.C.1 Sterilizing Filters that Will Be Used with Compressed Air

Sterile filters are used when compressed air is added to the aseptic system so that the compressed air is sterile when it enters the aseptic system. Specify the sterilizing medium, temperature, time, and any other factors necessary to sterilize the filter. If the sterilizing medium is a chemical, specify the threshold value as the minimum concentration of the chemical. Specify the maximum amount of time between sterilization cycles.

4.C.2. Aseptic Chamber Pre-Heating

If preheating the aseptic chamber is critical to achieving sterility (because it prevents condensation on the equipment), specify the heating medium, temperature and time necessary to heat the aseptic chamber before sterilization. If the heating medium is a chemical, specify the threshold value as the minimum concentration of the chemical.

4.C.3. Aseptic Chamber Sterilization

Specify the critical factors (such as sterilizing medium, temperature, time for circulating medium, sterile air overpressure, etc.) necessary to bring the aseptic chamber to a condition of commercial sterility before the start of the filling operation. If the sterilizing medium is a chemical, specify the threshold value as the minimum concentration of the chemical.

4.C.4. Container and Closure Sterilization

You must attain a condition of commercial sterility for both the containers and the closures before filling the commercially sterile product into the containers. Specify the critical factors (such as sterilizing medium, temperature, minimum exposure time or maximum conveyor/film speed, etc.) necessary to bring the container and closures to commercial sterility before filling the commercially sterile product into the containers. If the sterilizing medium is a chemical, specify the threshold value as the minimum concentration of the chemical. If the containers receive a different sterilization process

than the closures, specify one set of critical factors for the containers and another set of critical factors for the closures.

4.C.5. Other

Specify any additional critical factors used to achieve commercial sterility under “Other.” Report any temperatures in degrees Fahrenheit.

b. Critical factors used to maintain commercial sterility

4.C.6. Aseptic Chamber Sterilization

Specify the minimum amount of sterile overpressure used in the aseptic chamber to maintain the sterility of the aseptic environment in pounds per square inch gauge (psig). Refer to Figure 49 or Ref. 5 in this document for examples of how to represent this information.

B. ASEPTIC SURGE TANK:								
ID Number	Description of Critical Factor	Threshold Value	Unit of Measure	Limit	Control/P&ID Tag	Corrective Action	Record	Frequency
1	Sterilizing Medium - Steam	Saturated						
1.1	Minimum Sterilizing Temperature	250	[°F]	min	T2	Surge tank must be resterilized	Strip Chart	Continuous
1.2	Minimum Time	30	[min]	min	PLC		Strip Chart	Continuous
1.3	Sterile overpressure to maintain sterility	3	[psig]	min	P2		Strip Chart	Continuous
1.4	Other (add additional critical factors and associated details as necessary)							

Figure 49 – SUP SID information for Aseptic Chamber Sterilization in a Spreadsheet Format

4.C.7. Containers and Closures

Specify the critical factors necessary to maintain the sterility of the containers and closures (such as sterilizing medium, temperature, minimum exposure time or maximum conveyor/film speed, etc.). If the sterilizing medium is a chemical, specify the threshold value as the minimum concentration of the chemical. If the container receives a different sterilization process than the closure, specify one set of critical factors for the containers and another set of critical factors for the closures.

4.C.8. Other

Specify any additional critical factors used to maintain commercial sterility under “Other.” Report any temperatures in degrees Fahrenheit.

5. Signature

At the bottom of each document you submit as part of your Supplemental Submission, print the first and last name of the person authorized to represent the facility, as well as that person’s telephone number. The person authorized to represent the facility must sign and date the Supplemental Submission document.
